An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

ANCHOR POST FENCES

are built on anchor posts which are driven into the ground and then held rigidly erect by two Anchor stakes driven diagonally through slots clamped to the sides of the posts.

Iron Railings and Entrance Gates, Lawn Fences, Tennis-Court, Poultry and Kennel-Yard Enclosures, Arbors, Trellises, and Flower-Bed Guards. Catalogues of any or all are yours upon request.

As The Editor Sees It

SO much has happened in the Construction Industry in the last two years; events have followed each other so fast and close, that it is very difficult to view the situation as a whole and realize the full import of each phase of the situation. We all know that from a forbidden industry during the war, construction has risen to a foremost place among the industries of the country in the reconstruction period. That this sudden transition must entail much confusion and many difficulties is easy to see. "Economics of the Construction Industry," a book just issued by the United States Department of Labor, reviews as a whole the period through which we have just passed and contains a compilation of the surveys and analyses made during the first half of 1919 by the Division of Public Works and Construction Developments of the Department under the personal direction of F. T. Miller.

The subjects treated in this publication which are most interesting to the building trades are:

"The Decrease in the Puschasing Power of Money."

"Cost and Supply of Construction Materials."

"Labor and Wages in the Construction Industry."

"Sources and Supply of Capital for the Construction Industry."

"Rents and Land Values."

"Deferred Construction."

"Bibliography." (Presenting a very valuable list of references and authorities.)

"The function of the Information and Education Service," according to Mr. Miller, "had been to facilitate by means of educational publicity the transfer of labor and industry from peace to war production. When the armistice was signed and hostilities ceased, it clearly became the duty of the Information and Education Service to employ its means of publicity toward a restoration of labor and industry to a peace footing.

"Of the larger industries of the country the one which had been most severely curtailed was the construction industry, embracing public work and private building. Its prompt return to a condition of activity was a matter of public interest (1) in order to ameliorate the shortage of housing and of other private buildings, which was causing high rents and affecting the cost of living and of production; (2) in order to supply the deficiency in schools, hospitals, roads, water supplies, local transit and other public and semi-public utilities, the construction of which, and in many cases, the repair of which had been wholly or partly discontinued during the war; (3) in order to furnish employment to demobilized soldiers and industrial workers during the period of readjustment of the manufacturing industries.

In summarizing the work and conclusions the Department says:

"The instructions received by the Economics Section called for an investigation of those general economic factors which, taken together, determine the financial success or failure of a prospective investment in improved real estate and which consequently investors are in the habit of considering before undertaking the improvement of real estate. The division was organized to 'stimulate the interest of the Nation in public and private construction' with a view to the creation of buffer employment for labor during the period of transition of manufacturing industries from war to peace production. It was feasible and proper to stimulate interest in public construction on other grounds than financial profit, but as the responsibility for providing buffer employment was a responsibility of society as a whole, it was felt that the individual investor should not be urged to build except in obedience to normal private considerations. These differ somewhat according to the type of construction contemplated, but the most important is financial profit. It was decided, therefore, that stimulation of private construction should take the form of supplying authentic data to assist the individual investor to judge for himself whether or not it would be profitable for him to build.

20-Year Barrett Specification Roof on Buildings of Union Stock Yards, Limited, Toronto, Canada. Architects; Union Stock Yards, Limited. General Contractors: Archibald & Holmes, Toronto, Canada. Roofers: The Maitland Roofing & Supply Company, McDermid Bros., Successors, Toronto, Canada.

100,000 Square Feet of Barrett Specification Roofs

The above photograph shows the mammoth new buildings of the Union Stock Yards, Ltd., Toronto, in process of construction.

This is a roofing job of more than one hundred thousand square feet, covering one continuous building, extending back beyond the sixth monitor in the picture.

Naturally, in deciding what type of roof to adopt for this enormous plant, the question of cost had to be given careful consideration.

It is significant, therefore, that a Barrett Specification Roof should have been decided on.

It means that the Union Stock Yards architects fully realize what so many architects and builders have come to appreciate—that it *pays* to buy the *best* roof because, while the original cost may be a little higher, *the cost per year of service is lower than for any other type.*

Barrett Specification Roofs are used on more of the permanent structures in America than any other type of roof. They take the base rate of fire insurance and are

Guaranteed for 20 Years

So sure are we of the service Barrett Specification Roofs will give *under the most severe conditions*, that we are prepared to *guarantee them for 20 years*, in all towns of 25,000 or over, and in smaller places where our Inspection Service is available, provided they are 50 squares or more in area. The guaranty costs you nothing. We merely require that our Specification dated May 1, 1916, shall be strictly followed and that the roofing contractor be approved by us. The guaranty is a Surety Bond issued by a well-known fidelity and guaranty company.

Copy of The Barrett 20-Year Specification, with roofing diagrams, sent free on request

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

SHEETROCK WALL BOARD *Is Easily Applied*

While Sheetrock is easily applied as other wall boards, the firm gypsum rock sheets being easily sawed and nailed, Sheetrock can be applied more quickly than other wall boards because Sheetrock boards are uniform, fewer nails are required and the joint treatment is simple.

For the walls, ceilings and partitions of new buildings, or for alteration and repair work, Sheetrock is unequalled. Architects, contractors and carpenters recommend it.

Sheetrock Wall Board will not warp, crack or buckle and requires less paint or calcimine than other interior finishes. Saves time, money, labor and materials. Brightens the home and adds distinction.

A Waterproofing
or
A Damproofing
For Every Purpose
Made in Philadelphia

Years of specialized experience have proved that proper application is no less important than the use of highest quality materials.

We maintain local waterproofing engineers throughout the country to oversee the jobs where our materials are specified and to co-operate with architects and builders to see that a perfect job is produced.

Our engineers are ready to assist you in waterproofing and dampproofing problems.

What Builders Need

In their advertising merchants are apt to talk about goods—but listen to their *customers,* and nine times out of ten you will find that they are talking about *service.* It's the great force of modern business.

Lumber sold by different dealers is very much alike; but there is a great difference in *service.*

The best service you can get is none too good. When you build that new factory or store, the important thing is to choose the lumber dealer that will give you the prompt, efficient *service* that to builders so often makes the difference between failure and success.

Some day you will build. If you want the work finished on time, see that the lumber comes from LLOYD.

Washed Bar Sand and Gravel will take less cement on concrete work. We know how.
DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

(Continued from Page 3.)

"The provision of such data meant an investigation of the volume of deferred construction, of the recent course of construction material prices, of wages in the construction industry, of land values and rents, and of mortgage-loan conditions. As the financial soundness of a present investment in improved real estate depeds upon future earnings, an investigation of the economic factors just mentioned would have no practical value unless it revealed future tendencies. It was necessary, therefore, to compare prices and wages in the construction industry with prices and wages in general industry in order to show whether the former were relatively high or low, and hence likely to recede or advance in the process of adjustment to the general price level. It was necessary, further, to identify the principal causes of the rise in prices and wages during the war in order to balance those that were purely temporary against those that in the altered economic conditions brought about by the war must be permanent or semi-permanent.

"The investigation, while covering a rather wide field, required neither minute nor exacting research. It was extensive rather than intensive, designed to meet a definite trade demand for the latest information of a kind which the trade habitually uses. Most of the desired information, principally of a statistical nature, was already in eistence, collected by departments and bureaus of the Government, but not selected and compiled for our special purpose; and the rest was obtainable through questionnaires. Recognizing the urgent nature of the investigation by this section, the various Government departments and bureaus rendered assistance freely, in not a few instances permitting transcripts to be made of statistics and reports awaiting publication. This section, in turn, promptly released for publicity by the division all information of value which it received.

"The chief difficulty connected with the investigation was the short time available. If it was to serve the purpose set for it, the essentials of the investigation would have to be finished in two months, by the 1st of March. This was accomplished, and the present report is substantially a collection of papers, extended and amplified, which were used as sources for publicity by the division before March 1, 1919.

The more important findings of the investigation are the following:

1. *As to deferred construction.*

"A questionnaire relating to projects for which plans had been drawn but for which contracts had not been let prior to the armistice was sent out in January to 15,000 architects, engineers, public officials and others. The replies disclosed 6,472 deferred projects, estimated to cost $1,711,802,000, divided into 3,378 projects, valued at $481,062,000, for private owners and 3,094 projects valued at $1,230,740,000 for political and public-utilities corporations.

2. *As to recent construction.*

"The most complete construction statistics available cover contracts let for engineering and building construction north of the Ohio and east of the Missouri together with some adjacent area, containing four-sevenths of the population of the country.

"The contracts let in the first six months of 1919, compared with 1915 and 1916, run as follows:

	1919
January	$51,000,000
February	95,000,000
March	110,000,000
April	192,000,000
May	245,000,000
June	299,0000,000
	1915a
January	$70,000,000
February	79,000,000
March	122,000,000
April	124,000,000
May	125,000,000
June	149,000,000
	1916a
January	$87,000,000
February	92,000,000
March	131,000,000
April	140,000,000
May	182,000,000
June	195,000,000

aCosts broguht up to 1919 price level.

3. *As to prices of construction materials.*

"In April, 1919, the index number of construction materials, including steel, was 98 per cent. higher than in the year ended June 30, 1914; excluding steel, it was 84 per cent. higher.

"The index number for commodities in general was 10 per cent. higher in April, 1919, than in the year preceding the war.

"That is, building materials prices have rise nless rapidly than the general price level. If the price level stays up, the cost of building materials cannot well fall.

4. *As to wages in the construction industry.*

"The index number for union wage scales in 41 leading cities shows an advance of 28.5 per cent. since 1914. This percentage of advance is less than the

Pa.

percentage of advance in the cost of living or in wages in certain other industries.

"That is, if the cost of living and the general wage scale stay up, the cost of building construction labor cannot well fall.

5. *As to cost of construction.*

"The increase in the cost of construction varies with the type of project. It is somewhat more than 80 per cent. for a high-grade steel skeleton office building and somewhat less than 50 per cent. for dwelling houses and other buildings in which the metals group of materials is not so largely represented. It should be noted that neither of these increases is so great as the increase in prices in general, as indicated by commodity index numbers.

6. *As to land values and rents.*

"A questionnaire sent out in December brought replies from real estate boards in 91 cities. In 52 of the cities rents of residence housing (private dwellings, apartments, tenements) had advanced 10 per cent. or more, in some instances 40 per cent. to 50 per cent.

"Advances in rents of other kinds of property were unimportant.

"The market values of house sites had declined in six cities and had remained practically stationary in 72.

"Later information on rents and land values was sought through a questionnaire sent to 150 real estate boards throughout the country. Replies to this questionnaire were not returned in time to be of use in this report.

"In general it appears that rents, which have risen less rapidly than construction costs, are continuing to rise because of shortage of buildings.

7. *As to mortgage loans.*

"The main sources of real estate loans are savings banks, insurance companies and building and loan associations. Savings banks, insurance companies and building and loan associations have not grown so rapidly in resources as banks, other than savings banks, since 1913.

"The country's finances are well organized to serve (a) commercial needs, by commercial loans, the process being facilitated by the rediscount privileges of the Federal Reserve Banks; and (b) long term investment needs, by securities of guaranteed worth and of universal salability.

"The country's finances are not well organized to supply the demand for building capital through mortgages, the type of security almost universally used for obtaining such capital. The average mortgage is not of guaranteed worth, nor is it readily salable. Properly to finance the building industry, the standard form of long-term investment, namely, bonds, should be utilized more freely. Institutions are needed to hypothecate real estate mortgages and issue bonds against them. This has been done for farm mortgages through the Federal Farm loan banks; it is proposed for building mortgages through home loan banks and a proposed Federal mortgage bank. In that direction lies the best hope of the building industry for recovering the use of its former share of the Nation's capital. Another measure that has been urged on Congress is the exemption of limited amounts of mortgage loans from the operation of the income tax, to the end that these securities shall net as great a return to the investor as municipal bonds, Government bonds, farm loan bonds, and other similarly exempted investments."

STONE AS A BUILDING MATERIAL

By John Y. Dunlop.

Never before has any greater attention been paid to building materials, for it has come home to all classes that this is a matter which affects both rich and poor alike, and that unless all of those whose business it is to produce building material get set agoing at once, we shall soon be suffering from a greater shortage that at present.

Quarry masters, whose occupation and livelihood have been dependent on the production of stone, have not been fortunate in getting the ear of the public, with the result that they have been watching and waiting and surveying with certain misgivings the indifference which seems to have so far been displayed toward their contribution to the production of building material which they are willing and anxious to make.

There is no lack of good sandstone or limestone in England and experts still tell us that stone has never been surpassed as a building material. In the stone districts, previous to the war, one would not have dared to suggest to build a house with another material. Even the smallest cottage had its stone front and gables and the stone chimney was one of the crowning features of the way-

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

side cottage in those districts.

No one, with any experience of the building trade, would think for a moment that the formation of a stone opening could be done so cheap as the building of brick sides and lintel of a window. But this I do know, that taking a large area of stone wallings of a good type and, if compared with a brick wall of good stock brick, the difference in cost was not worth considering.

Why then has this class of work disappeared so completely from among a class of builders who were so much wrapped up in it previous to the war?

This great industry is one of the oldest in our own country and to those of the trade who have visited the Old Country, the splendid stone buildings which have been seen, give evidence that stone in the building of our houses and other buildings has always been an important material. It is an industry which has employed thousands of workmen and trained hundreds of apprentices every year.

The principal stones which were quarried in Britain before the war were granites, marbles, limestones, and sandstones. Other kinds of stone were used in the construction of walls, but only in the immediate neighborhood of the quarry. The use of granite in building except in the neighborhood of the quarry is almost restricted to ornamental features.

Limestone and sandstone are the principal building stones used in the British Isles. Marbles are used for ornamental purposes, as the best varieties are too expensive for general construction.

Stone walling, whether of sandstone, limestone or granite, is named according to the shape and finish of the material. The principal kinds are rubble, square rubble and ashlar, and each of these has several subdivisions.

The strength and imperviousness of masonry walls depend very much on the quality of the mortar used. If the mortar is not good a wall is bound to be more or less unsatisfactory.

Flints and igneous rocks are exceedingly dense, non-absorbent and practically proof against atmospheric attack.

Uncoursed rubble, with hammer dressed joints, is generally known as rustic work. Frequently rubble walls are finished externally with stucco. The stones on the exposed angles of the walls are usually made to project and the stucco work finishing flush with the stone, thus forming a quoin effect.

Square rubble gives a better and neater kind of work than random rubble. Sandstone lends itself very readily to this treatment.

In most of the well-known sandstone quarries the rock splits naturally into slabs from 6 inches to 7 inches thick, and the slabs are then cut to the required breadth, usually 6 inches. The quarry companies prepare the stones ready for building in two ways; with a face which is machined fairly smooth, or rock-faced, which is left with rough projections, but has the joints pitched to a line formed with the hammer and pitching tool or chisel. The rock-faced stone wall is usually more expensive than the other.

With snecked rubble there is a great variety of stones having different depths, thus breaking the horizontal courses into short lengths. The small stone at the end of a course is known as the sneck, and the stone with the deepest face is known as the riser. Often the risers are specified to be of 11 inches or 12 inchees, which means, then, that the courses used in that particular job will be 5 inches and 6 inches, or 5 inches and 7 inches.

Ashlar stone walls are usually built with freestone. That is, any class of stone which works freely under the tools. The different kinds of finish given to ashlar stone walls on the face may vary from rough rock-faced to the finest tooled and the smoothest rubbed.

The vertical joints of hand-wrought ashlar stones are very often scamped on the back. That is, they are seldom squared back far enough, which often leads to damp walls. Bed joints are known to have been wrought in the same way, which may lead to the cracking of stones, due to the weight being concentrated on the edges instead of over the whole bed.

Our early builders were sorely tried in their attempts to build dry walls of porous material, and in districts where the west winds were so fierce that the trees took a permanent set to the east, the difficulty was great.

The sandstones, although hard and durable, are undoubtedly porous. So porous sometimes that rain is driven through the stones, and bubbles come out and trickle down the back of the stone.

The usual defects in the construction of such work are inward sloping bed joints and through bondstones. Two bondstones are better than one in the most of cases, and square joints which have a uniform thickness of bed is a cure for the most of dampness. Another practical defect is the absence of a damp-proof course.—*National Builder.*

THE ARCHITECT AND THE DRAFTSMAN.

By Victor Eberhard,

Magaziner and Eberhard, Architects, Philadelphia.

The draftsman who went to war has failed to return to the drafting-board; they say he has found more congenial employment and better pay elsewhere.

The architect is busy again and needs him; he must have him, in fact, and a substitute cannot be developed overnight. What is he going to do about it? There is but on ready answer: "Get him back to the board." Does this mean that he should be looked up and argued with? That's hardly practicable. The answer is that draftsman's job should be as attractive and as well paid and have just as many possibilities as similar jobs in any other line. If it is not so now it should be made so.

For a man to become a capable draftsman means a serious effort, years of hard work, often overtime work, and generally a real liking for the business. He should be able to do better for himself by using this knowledge and ability than in doing anything else. He will not leave it for something else if it gives him somewhere near the return his brothers in other lines are obtaining.

The fact that so many draftsman have refused to return to the drafting-room after leaving the army is an indictment against architects, their offices, and the methods which architects have employed in dealing with draftsmen.

Is it possible that the draftsman job has not been as desirable, either from a point of view of pay, pleasant working conditions, or for future outlook, as the jobs of men in other lines of work? It is not only pssible, it is and has been a fact since the writer can recall. It is not the fault of the draftsmen; they have been as good as other workers. It is distinctly the fault of the architects. They have failed to accomplish anything for themselves as a body, they failed in the conduct of their individual offices. They have lacked vision; they have not known the meaning or value of co-operative effort or of how to obtain individual effort. They have been selfish and short-sighted and have not allowed themselves or their men to extend to their fullest. The result of all this is that they have wasted a great percentage of their own work and that of their men. The returns for all have been small, and for all the outlook has been unpromising, the profession abused; and, worse yet, our ar-

Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

chitecture is the mirror in which all this discord and failure is reflected.

The architect first of all should try to get a distant view of himself and his office in relation to other business, he should try to see his office as an integral part of a business system or order such as he would wish to subscribe to, one that is based on honesty and fairness and congeniality. He should question whether is office is representative as a unit of such system. He should feel his responsibility. A million like him seeking to be right would go far toward making this country the right sort of place. He is one of the million.

Does he realize, and act as if he did, that the men working for him are of the same clay as he; that for every ambition that he has, for every aspiration, the man in his drafting-room has one to match; that as he finds it pleasant and stimulating to have his experience broaden out, so also does his draftsman, and that the one the same as the other becomes stifled when one day is just the same as the one before and the one after.

Now, having thought this over, he might call into his private office one of his draftsmen who has been diligent and tell him he is satisfied with his work, and for him to carry on, that he should not be ambitious to leave and go into business for himself unless he is willing to take a hundred chances, but that his ambition might better be in the way of making himself more useful and necessary to the office, and the office would, in turn, stand by him.

Having said this, how about outlining just what the office is going to do for this draftsman? Let him keep his job and give him a raise once in a while? That's not enough. He has a little more coming to him than that. It's not just a case of a job with this sort of man. It's his life's effort he is giving. He has a right to expand this effort to his limit. Mr. Architect must realize this, if he wants the best out of his man, and act accordingly. He must think of his draftsman as his brother architect. That's the keynote. Some time the one is the better man, some time the other; there's no rule. His draftsman is working with him, not for him.

On the one hand, it is a plain business proposition. The architect allows his draftsman to do his best because it will pay him best. On the other hand, it is the decent thing to do. It is the "esprit de camaraderie" in its best terms.

There is necessary a better understanding between the architect and the draftsman; the draftsman to learn more of the point of view and the troubles of the architect and the architect to know his draftsman better. So long as either believes this is not worth while doing the profession will have a handicap; but if accomplished it will prove in just the same proportion a big help.

Prospects for construction activities in 1920 are exceptionably favorable, says the *American Contractor*. The demand for all kinds of buildings is greater than ever. Highway construction is to be undertaken on a scale heretofore unknown. Railroad extensions and improvements can not be deferred much longer. It has been estimated by one authority that four billion dollars must be spent on our transportation lines before they are brought up to current requirements.

Of course, the great handicap in the construction field is construction cost; the price of materials and labor. In the long run these will prove of some permanent benefit to the construction industry, for they have forced contractors and the professional elements in the construction world to apply themselves to improving management and methods to effect economies. The larger contracting firms are figuring out new, better and cheaper ways of doing work. These forced improvements are permanent additions to the knowledge and practice of the industry; they will remain with us when prices are not so high. In this sense the construction cost level is proving a blessing.

Authorities appear to be agreed that we may expect no recessions in wage levels during 1920. Labor is the major factor in construction costs and if there is to be a noticeable reduction in construction costs, other than the reduction incident to improvements in management and methods, it must come from an increased efficiency in labor.

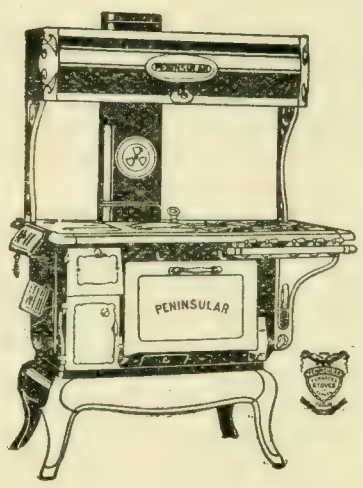
It is obvious to all who have studied conditions now prevailing in the United States that there is a labor shortage. The only possible way we can make up the deficiency of goods resulting from the war and take care of current demands is to increase efficiency, and without this, wage advances will offer no relief from the cost of living. Quite the contrary; increase in wages will add to the cost of living.

Men must produce more and this holds true from the president of the company to the janitor. When the boat gets into the rapids one cannot safely regulate his turn at the oars by the watch. We are in some very rough water and the only way to come safely through is to do our utmost at the oars until we are in quiet water.

Industrial programs, wage increases, shop committees, union agreements in themselves will not produce as much as one pair of suspenders or grow as much as one potato. Just common hard work, indeed, in these uncommon times, just uncommonly hard work will produce.

The history of 1920, in large measure, is in the hands of the workers. With reasonably conscientious effort on the part of those who produce, the new year should prove the greatest in the history of the construction industry in the United States.

PAINTING STRUCTURAL STEEL.



Red lead is a favorite paint for this purpose. Red lead is usually made from litharge and if it contains an excess of this substance and is mixed with oil, it soon becomes stiff and hard to work. Manufacturers now make red lead that is over 98 per cent. pure, thus insuring it against this fault. Red lead may be obtained in paste form similar to white lead and thinned for use by adding linseed oil. Dry pigment may also be obtained and mixed with oil by the user. In the latter case from 25 to 30 pounds of red lead are mixed with one gallon of oil.

Other paints which give good satisfaction are made of graphite and linseed oil. Lampblack is often mixed with graphite paints with good results. Asphaltum is also used as a varnish for structural steel.

An important requirement for a good job is that the steel must be perfectly clean. It is even more important for steel to be clean to receive paint than it is for wood. The pores of wood afford some mechanical bond for paint, but with steel the only bond is that of adhesion. All rust spots should be entirely removed with scrapers and wire brushes, using a hammer and cold chisel for cutting out rust pockets.

Two coats of paint are commonly used, but three are better. In two-coat work it is advisable to go over the edges and the rivets with a striping coat before the second coat is applied, as these points are likely to hold only a very thin film from the first coat. Allow at least a week between coats. All contact points should be thickly painted. On important work the first coat is usually applied at the mill. In such cases it will be necessary to inspect the material carefully for places where the paint has been damaged by rough handling.

The importance of covering every portion of structural steel can not be too strongly emphasized. Under many conditions steel is more perishable than wood and carelessness in painting may be responsible for serious depreciation that may result in the failure of structural members. Shapes that are difficult to paint are avoided by conservative designers. This is an important reason for the growing disfavor for beam box girders—made of two I-beams with top and bottom plates—it is impossible to properly coat the inside of such a shape. —*National Builder.*

A Few of the Reasons

why you should install the **Peninsular Combination Range:**

A Range that burns either Gas, Coal or Wood without any changing or removing of parts—separate or both at the same time—whose oven is always ready for instant use.

A Range that takes up no more space than an ordinary kitchen range, bakes and broils perfectly under all conditions and gives a lifetime of such service.

A Range that makes the kitchen cool in Summer, warm in Winter—beautiful in design, substantial, and easy to keep clean. Secure our prices.

Brownstone Bricks

2,000,000 at $16.00 f. o. b. Reading Sidings.

These are high grade pressed bricks, manufactured of crushed stone and hydrated lime. Greater crushing strength and lower absorption than burned clay. Uniform in shape and size. No soft ones. They are beautiful, economical and everlasting.

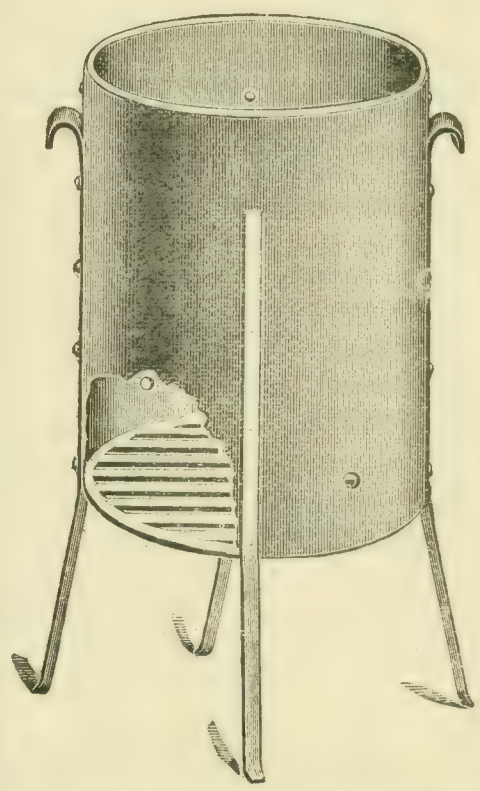
Red, Gray & Buff Face Bricks

A complete range of colors. Manufactured of vitrifying shale and fire clay. Our prices defy competition.

Straight Hard, Stretcher and Salmon Bricks

All Shale Bricks in carload lots, delivered on job at competitive prices. We are shipping 200,000 bricks daily to 28 building operations.

Vitrified Paving Bricks



Standard specification pavers at lowest market price.

One of the many "reasons why" so many homes in and near Philadelphia are being equipped with the

Direct Action Gas Range

is that its patented oven heat regulator eliminates all guess work in cooking and enables one to obtain the same results at all times. It SAVES GAS, TIME, FOOD and WORRY!

We have it connected up with gas on our sample floor and shall be glad to have you and your clients call any time to witness a demonstration. An attractive booklet showing the entire line is yours for the asking.

BORDEN STOVE CO., 1311-1313 Arch St., Phila.

The Touraine Apts, 1520 Spruce street; the Daniel E. Hogan Operations at 54th and Wynnefield avenue, and 60th and Columbia avenue; the William Pilton Operation at 5959 Larchwood avenue; and the Presser Operation at Yeadon, Pa. are a few of the many operations which are enjoying the advantages of the DIRECT ACTION GAS RANGE.

No More Ashes To Lug

No clumsy pan to spill dust and dirt on the kitchen floor

The Glenwood Ash Chute

solves the problem. It is located just beneath the grate and connected by a sheet iron pipe straight down through the kitchen floor to ash barrel in cellar. No part is in sight. Not a particle of dust can escape. Just slide the damper once each day and drop the ashes directly into the ash barrel.

The Dust-Tight Cover

to barrel is another entirely new Glenwood Idea and is very ingenious. This is only one of the splendid improvements of the new plain

Cabinet Glenwood

the Range without ornamentation or fancy nickel, "The Mission Style" Glenwood. Every essential refined and improved upon. This Range can be had with the latest and most improved Elevated or End Gas Range attachments. It can be furnished with fire box at either right or left of oven as ordered. Our handsome booklet tells all about it.

As The Editor Sees It

THE year 1918 distinguished itself by outclassing all previous low records for construction work. In spite of the very discouraging report for that year, the termination of the war and the lifting of the ban on building filled everyone with such high hopes for 1919 that the sad record established by 1918 did not cast the gloom which it ordinarily would.

All was not smooth sailing, however, for 1919. Strikes retarded the building industry as well as many others indirectly affecting it, and during the months of April, May and June, the building trades led the list in the number of strikes, furnishing 200 out of a total of 974 of these activities. Labor was scarce and high, materials were scarce and high, and transportation was most uncertain. But 1919, in spite of these and other obstacles, fulfilled the prophecies made about it, and in Philadelphia broke all records.

A total expenditure of $65,088,750 was authorized by the Bureau of Building Inspection for the improvement of Philadelphia real estate last year.

This is more money that has ever been spent for that purpose in any previous twelve months in the history of the city.

This does not mean that more property was improved last year than in any similar period theretofore, for as a matter of fact, the number of operations falls considerably short of the number undertaken in several previous years, it simply means that it cost property owners considerably more per operation to make improvements, because of the tremendous advance in the cost of building materials, amounting in some cases to from 100 to 200 per cent.

Operations undertaken last year numbered 14,509, a little less than the average, although their cost amounts to more than four times as much as was invested in the improvement of real property in 1918, is nearly twice as much as was spent for the same purpose in 1917, and is more than one and one-half times as much as was spent for buildings in any previous year back to and including 1909.

The table of classification printed on another page of this issue shows that 5,291 houses were built last year, at a cost of $27,740,765, while less than 1,000 were built in 1918.

While this increase is encouraging, it is still far below the average, about 7,500 houses a year, built prior to the war, and the city is still about 30,000 houses short of the number necessary to supply the demand.

The following table shows the total for each year back to and including 1909:—

Year.	Options.	Estimated Cost.
1909	17,294	$42,881,370
1910	16,383	37,866,565
1911	16,215	40,030,985
1912	14,907	37,173,635
1913	14,813	38,763,850
1914	15,709	35,419,605
1915	17,712	39,444,125
1916	15,613	49,896,570
1917	8,977	34,016,480
1918	5,950	15,452,670
1919	14,509	65,088,750

The Forty-second Ward, with 2,326 operations to cost $9,604,205, leads the city in improvements, most of which were new dwellings. The Thirty-fourth comes next with 1,360 operations to cost $6,724,045, while the Fifth with 100 operations, one of them an office building, is third with a cost estimate of $5,626,520.

It is easy to see from these statistics that the building era is just begun. Prosperity looms large on the horizon and everyone must be ready to do his part in the great work of the present and future. Zoning, city planning, good roads, better schools, better living conditions are all subjects of vital import. From every side comes the forecast of big work and big improvements for 1920.

"San Francisco," says the *Architect and Engineer* of California, will lead all Pacific Coast cities in new building construction next year, according to advance figures gathered from state, county, and municipal channels, architects, construction engineers and others in touch with building operations. One hundred and fifty million dollars is a conservative estimate of the cost of new construction

DRAWING MATERIALS

CHARLES H. ROBBINS, JR.

BELL PHONE, WALNUT 1086 KEYSTONE PHONE, RACE 614

BLUE PRINTS

work in the Coast cities in 1920, with very near one-half this sum to be spent in San Francisco and the Bay region. A greater sum will be expended in 1920 for new school houses than for several years past, due to the steady increase in population and the almost complete cessation of this class of building operations in 1918-19 on account of the war. Among the California cities that have voted bond money for new school buildings and which money will become available next year, are the following:

San Francisco	$3,500,000
Oakland	4,750,000
Sacramento	3,000,000
Berkeley	1,250,000
Fresno	1,250,000
Cupertino School District	100,000

Other public work, exclusive of the twenty or more millions that will be spent for state and country highways, includes the Capitol Extension buildings in Sacramento, to cost $3,500,000, and the State building now under construction in the San Francisco Civic Center at an outlay of $1,250,000, together with various smaller projects, such as additions and betterments to state institutions, the work to be carried on by the State Department of Architecture at Sacramento, from funds appropriated by the last legislature.

There will be more office buildings erected in San Francisco in 1920 than for several years as a result of an urgent demand for modern offices in the business section. Similar reports come from all sections of the country.

But, warns the *American Contractor* our war experience has taught us a great deal about the High Cost of Doing Things in a Hurry. The old adage "Haste makes waste" has been demonstrated in a most spectacular way. Prevailing construction costs suggest the desirability of taking full advantage of those economies possible through foresight, preparation and planning. These latter are possible only where a given project is decided on and plenty of time is given the contractor to set his house in order.

Next year, it now appears, is to witness feverish activities in the construction industry. The major undertakings now are being formulated. The sooner they are carried to the degree of maturity justifying the letting of contracts, the better. If the contractors on these projects are to render maximum service at minimum cost, they must have time to plan and organize.

The highway program for next year calls for an unprecedented volume of construction work. Before work can begin finances must be arranged, construction organizations must be brought together or strengthened, new equipment must be installed and old equipment made serviceable, an adequate supply of materials must be found and transportation—one of the serious problems—must be arranged for.

None of these preliminaries can be arranged until the contractor knows he is to have the job. Builders—whether governments or private interests—will find in 1920, as never before, the early bird will get the worm; the project first in the field will have a decided advantage on materials, labor, and construction organization. Right now is the time to get underway for an early start. On such work as will admit of it, contracts should be awarded now. Not only will the early start permit more work to be done, but it will obtain for the builders, whether private investors or the general public through their taxes, the important economies possible only where the contractor has plenty of time to plan his work and organize his forces for maximum efficiency.

Builders and architects in Philadelphia are already awake to the opportunities open to them as well as the difficulties confronting them, and it is safe to predict that Philadelphia will make 1920 another, and still greater, record-breaking year.

* * *

THE IMPREGNABLE POSITION OF THE ARCHITECT

It has been said that the architect is trusted to a greater extent than he physician is trusted—because the former is trusted with the expendiure of large sums of money, yet his spending is seldom or never questioned by the client. The physician is trusted with one's life, it is true; but there is no record of how trustful their patients would be if it were (in this day and age!) a question of cash instead of life.

However this may be, the point is that architects enjoy the highest confidence of the public, when it concerns the decisions regulating expenditures or selection of materials or specialties that are to go into a structure. The architect's integrity is seldom or never a matter of debate. He is taken at his own valuation, as that of an absolutely disinterested party whenever the money part of a building is concerned. The only question that may ever have been raised against him was that in some of his designs he has aimed to create prestige and glory for himself rather than to produce a building best suited to the owner's needs.

* * *

But as to his say-so regarding just what was to go into the work, or the amounts to be spent, his word is taken to be final, and his approval is acquiesed in with little or no questioning as to his motives. He is not suspected of having ulterior or mercenary motives guiding him in selection or naming of certain materials or equipment.

This high standing, well earned by the architectural profession by its past acts and proved and tested by long years, is a precious asset that must not be lightly ignored. In anything that is done by the profession in the future to further adjust itself to world changes and conditions, its integrity as a just arbiter between interested parties, its honor built upon disregard for selfish profit from the operations which it supervises, must be maintained.

It is the bed-rock upon which the foundations of the whole architectural professional structure rests. No profession or business, no group of men, no organization, can desire a finer basis upon which to establish itself. And such a basis cannot be acquired overnight. Taints cannot be eradicated in one generation. Reputations for character such as are enjoyed by architects are the cumulative products of a succession of generations of honorable acts on the part of the architects hemselves.

* * *

All honor to those of the past who helped sustain this high integrity! The profession today, in the swirl of world changes, is beset on every side by temptations to do as others seem to be doing. Its traditional slowness, its traditional unwillingness to depart from custom, mayhap, is the reason for the profession's proceeding so cautiously along the road today, to find its way out under the new set of world conditions which it is facing.

The unique glory of the architect rests not alone in his practical work for humanity, the betterment of living conditions and surroundings, in the creation of objects of beauty which further lead to the higher inspiration of the rest of his fellow-men, and which leads, too, to an encouragement of men to continue their efforts toward higher things. The architect's glory is due in part to these things, but, after all, his highest honor is that which is awarded him universally—in America at least—of that of being an honest man, incorruptible.—*Building Review,* New Orleans.

All advertising pays—even that which is poorly constructed. A bad ad. is better than no ad. at all. It is worth all that it costs in the competitive world of the present day, merely to keep one's name where the possible buyer cannot help seeing it To be out of sight in the commercial world is to be out of mind.

Advance Construction News

CONTEMPLATED CONSTRUCTION; ARCHITECTS AND OWNERS; COST LIMIT; LAST DAYS FOR FILING BIDS; FIRMS FIGURING; CHARACTER OF MATERIAL AND EQUIPMENT REQUIRED; ADVANCE INFORMATION IN EVERY PHASE OF NEW CONSTRUCTION

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

SHEETROCK
WALL BOARD

In New or Old Homes

Solves Your Plaster Problem

Sheetrock improves appearances anywhere—it embellishes, transforms, enhances the furnishings of homes of all kinds.

Sheetrock will save you time, labor, trouble, money. **Sheetrock** means more profit on your work for **Sheetrock** is a plaster substitute as acceptable as plaster itself.

And **Sheetrock** will never crack, crumble and fall as plaster must—eventually.

Sheetrock is more than wall board. It is plaster in wall board form. The pure gymsum rock center is the rough coat—the mineralized paper sheets the finishing coats. No need of furring compound or other insulation where **Sheetrock** is used for **Sheetrock** effectively insulates heat and cold.

LLOYD

Established 1868

Plans or No Plans

There are two classes of builders who need the help of a strong, modern lumber centre,—those who have *planned* their operations well, and those who haven't.

If you have planned well, you will need a strong organization to help carry out your plans. The best is none too good. In big building operations, all of our experience and resources, including the powerful aid of our Traffic Department, are constantly required.

But if you have *not* been able to make careful plans; if you are forced to build hastily and under pressure, then only an uncommonly strong organization will enable you to accomplish your purpose. When you need unusual stocks or service that you have no right to expect, then the resources of the LLOYD organization will often save the day for you.

Some day you'll build. If you want the work finished on time, see that the lumber comes from *LLOYD.*

WILLIAM M. LLOYD COMPANY

THE LUMBER CENTRE

Hardwood Flooring H. B. Short Shingles

29th and Ridge Avenue, Philadelphia SOUTHERN OFFICE: CHARLOTTE, N. C.

Wark & Co., 1737 Filbert street; Frank G. Stewart, 1619 Sansom street, Philadelphia; Dunleavy Brothers, W. K. Thorn, William Elliott, Wesley Beard & Son and Horace Entrekin, all of Coatesville, Pa., are figuring.

Cottage, Hernhard Bay, N. Y. Architects, Mitchell & Neely, 1619 Chestnut street, Philadelphia. Owner, Herbert W. Hess, care of architects. Frame, 2 stories, 25x30 feet, shingle roof, pine floors, stone foundations. Plans in progres.

GEORGE T. PEARSON

George T. Pearson, widely known in architectural circles, died last week at his home, 125 Westmoreland avenue, Germantown.

Mr. Pearson was born in Trenton, N. J., seventy-two years ago. He came to this city at the age of twenty-two and became an assistant to the city architect. In 1879 he opened offices of his own. Among the buildings which he helped to plan are the City Hall, the Ridgway Library, and the Philadelphia Cricket Club. He also furnished plans for many hotels and private residences.

In 1871 he married Miss Mary Pingree and established his home in Germantown, where he lived until the time of his death. He is urvived by a son, Roderick Pearson, an engineer.

HOW TO RETAIN THE BARK ON LOGS USED IN RUSTIC CONSTRUCTION.

For preventing the bark from flaking of logs used in rustic structures, the Forest Products Laboratory, Madison, Wis., recommends the following methods of seasoning and preparing the timbers as the most effectual:

1. Cut timbers late in summer and score on two sides; that is, cut off narrow strips of bark for the entire length. Pile in shade in open pile to allow thorough circulation of air. Allow timbers to season until following spring or summer before using.

2. Proceed as in (1), and in addition, coat ends, stripped portions, and knots with coal-tar creosote, using one coat a few days after timber is cut and another just before using the timbers.

3. Proceed as in (1), but do not score bark. When timbers are in place, tack bark on with large-headed nails, placing one to every square foot of surface. Paint heads of nails to resemble color of bark.

4. Tack or nail the bark on without particular attention to time of cutting or other treatment.

The nailing method has been used successfully by one western company which maintains numerous rustic hotels, and also on a large rustic building erected for exposition purposes.

THE INTERNATIONAL TRADE CONFERENCE

Its Work as Related to Construction

NOBLE FOSTER HOGGSON.

Although a number of definite steps of far-reaching importance were taken at the International Trade Conference, held at Atlantic City during the week of October 20th, perhaps the most important result of the conference, as a whole, was the conviction carried away by the delegates that in the conference hall had been born a movement of transcendant importance to the prosperity of the whole world and to the United States as an integral part of the world of commerce.

To the American delegates the most interesting question, naturally, was the possible effect of the conference upon American prosperity. They learned, those of them who had not realized it before, that the affairs of America have become so closely related to the affairs of Europe that co-operation within a nation is no longer sufficient for national prosperity. The commercial interdependence of Europe and America was well described by A. C. Bedford, acting chairman of the conference, when he said:

"The war has made us realize that it is not only necessary to sell to the nations of the world and buy from the nations of the world, but that we have a direct interest in actually promoting on its own account the prosperity of the world, not alone of that part of it comprised within our national boundary lines, but quite as much the prosperity of lands remote from our own."

One of the most vital subjects considered was that of credits, and it was brought out that unless Europe were helped to its feet America could not hope to prosper and flourish, that we must help France, Belgium and other nations with credits before we can expect them to trade with us on a healthy basis. Secretary of Commerce William C. Redfield expressed this idea when he said:

"I hope and believe that we shall open our doors much more widely than we now do to receiving goods from abroad, for we cannot sell if we do not buy. . . . We cannot sell unless we supply credit."

and Company, in an address on "The Problems of International Credits," which was very enthusiastically received by the delegates at the Thursday evening session, said that the credits extended to our former allies would be based, as credits always are, on character, and that the allies had thoroughly demonstrated their integrity and their responsibility during the trying days of the great war. He estimated that about $2,000,000,000 would have to be raised for this purpose, and pointed out that the money could be raised by saving. Mr. Morrow said:

"In this great enterprise of restoring Europe there is one indispensable man that you cannot get along without, and that is the plain, old-fashioned gentleman who produces more than he consumes and is willing to save the difference. . . . If the 100,000,000 people in the United States would save twenty cents a day on the average, that would amount to $6,000,000,000 saved in 300 days. A large portion of that amount would be needed for necessary capital expenditure at home, and the balance would be available for Europe. I do not think that there is any doubt that the amount of fresh capital can be produced that is needed by Europe in order to aid in this process of restoration."

Definite Results of Conference Were Twofold.

Among the chief specific results of the conference were: (1) Laying a foundation for the establishment of an international organization of business men in the nature of an international chamber of commerce. (2) Clarifying the problems of international credit and reaching the decision that neither the American government nor American banks can or should alone supply the necessary loans to Europe, but that individual investors should make loans through private corporations aided by the bands and encouraged by the government.

The finance committee, in its report to the conference, stated that the requirements of the European nations could be met and it recommended the formation of credit corporations under the terms of the Edge bill.

One of the most interesting addresses of the conference was that given on October 24th by Eugene Schneider, chairman of the French Mission and internationally known as head of the great Creusot works in France, which supplied "Seventy-fives" and other guns not only for the French army, but for America, Great Britain, and others of the allies. M. Schneider discussed in detail the present conditions of the mining and steel industries, the important textile industry, the chemical industry, agriculture, transportation and commerce. He said that France will soon take second place in the list of the world's steel countries, following immediately behind the United States, and that her engineering industry will follow the lead of her steel industry. An indication of what France is prepared to do in the way of encouraging industries that depend upon fuel for their prosperity is revealed by his statement that, because of the lack of coal and the need of a substitute fuel, the French government recently lowered the tariff on fuel oil from twenty-five dollars per ton to eighty cents.

Great Field for Construction in Colonies.

M. Schneider was highly optimistic as to the economic feature of the French colonies, as well as France, and of their capacity for development with the aid of American capital. He siad in part:

"The trade of northern Africa is increasing year by year. It amounts to more than $500,000,000. . . . Construction of new railroads will be of the greatest benefit to the development of our colonies. Algeria, one of the oldest, has more than 3,500 miles of highways and 2,000 miles of railroad, while Morocco has only 450 miles of narrow gauge railroad under the control of the military service. A new system of railroads, about 600 miles long, is under construction.

"Harbors must be developed on similar lines. For Algiers, a sum of $20,000,000 has been provided. The construction of the port of Casablanca, capable of handling 1,500,000 tons of shipping, is being rapidly pushed ahead. Other ports . . . have been improved.

"These few facts will enable you to understand the possibilities of our colonial territory, which includes, besides North African possessions, prosperous countries like West and Central Africa, Indo-China, Madagascar and the French islands of the Antilles and the Pacific. These colonies will send wheat, vegetables, oils, lumber. American co-operation in that line would probably give most excellent results."

Discussing conditions generally in Frasce, M. Schneider said:

"The reconstruction of our devastated regions is today in full swing. . . . At the time of the armistice we had 1,400 miles of railroads to rebuild and by September 1st of this year we had completed 1,250 of the total. We had 1,160 bridges, tunnels and viaducts of one sort and another to rebuild, and bp September 1st we had already completed 588. Of 670 miles of navigable waterways to be repaired we had already finished 450 miles at that same date. Out of 550,000 buildings destroyed or damaged by the war, we had repaired 60,000 by the beginning of last month, put up 16,000 huts and begun the construction of 60,000 new homes. We have cleaned up shells over an area of 1,500 square miles and have filled in nearly 80,000,000 cubic yards of trenches. We have sent back 990,000 refugees, opened 5,000 schools and reorganied 3,872 civic communities.

"That, gentlemen, is the reply to those who believe that we are standing with folded arms. . . . But I call your attention to the fact that those who state today that France is at the end of her strength, that she is exhausted by war and that she will not recover are those very people who shouted in 1914 that our defeat was inevitable, and who predicted that at the end of three months' fighting the French people, discouraged, would accept a dishonorable peace. . . .

"Gentlemen, you can have confidence in us. We are able to live. We desire to live. Help us to get out as quickly as possible from the difficult period we are now passing through. Help us to re-establish our commercial balance and

Comparative Durability of Green and Seasoned Timber.

Opinions of wood users have always differed as to the comparative durability of untreated green and seasoned timbers when used for poles, posts, or ties. Recent experiments conducted by the Forest Products Laboratory indicate that there is practically no difference in the relative durability of untreated green and seasoned timbers when exposed to the weather and in contact with the ground.

The following service records of ties laid by the laboratory in co-operation with the Northern Pacific Railway bear out this conclusion:

Life of Green and Seasoned Ties:

Place—Maywood, Wash. Species—Douglas Fir; Green; average life in years, 7.7.

Place—Maywood, Wash. Species—Douglas Fir; Seasoned; average life in years, 7.8.

Place—Plains, Mont. Species—Douglas Fir; Green; average life in years, 7.6.

Place—Plains, Mont. Species—Douglas Fir; Seasoned; average life in years, 7.7.

Place—Plaints, Mont. Species—Western larch; Green; average life in years, 7.3.

Place—Plaints, Mont. Species—Western larch; Seasoned; average life in years, 7.4.

In each of these cases the average life of seasoned ties was only one-tenth of a year longer than that of the green ties. This difference is obviously so slight as to be negligible.

Periodical measurements on poles made by the laboratory in co-operation with the American Telephone and Telegraph Company show that the rate of decay in green poles is a trifle less than in seasoned poles.

The fact that green and seasoned timber have the same durability when used in exposed places is easily explained. Moisture content is the principal factor in determining the rate of decay of a stick of timber. As soon as the timber is placed it begins to take up or give off moisture, according to its condition of seasoning and the conditions of exposure. Within a relatively short time in exposed construction both green and seasoned timber reach the same moisture content.

When used in buildings, however, wood does not usually dry out rapidly after being placed. Wood for interior construction must be seasoned before use, otherwise, it is likely not only to shrink to a serious extent but also to decay before it seasons. Very expensive building repairs have been necessitated by the use of green timber.—*National Builder.*

UNION OF UNIONS TO STIMULATE BUILDING

To stimulate building 41 unions in New York City have organized and will meet soon in the office of the City and Suburban Homes Company, 624 Madison avenue, to discuss plans for the stabilization of wages and the encouragement of building operations.

At a preliminary meeting 41 unions were represented, all in the building trades except the bricklayers and masons. It was pointed out at the meeting that capital is hesitating in its support of new construction because of the constanly increased wage demands and consideration was given the suggestion of Major Warren Bigelow and Mr. Robert H. Brush, representing the Re-employment Bureau for Soldiers, Sailors, and Marines, that a definite wage scale be fixed.

Following the next conference it is expected a mass meeting will be called so that the proposition can be laid before all the union men.—*Exchange.*

The only road to advancement is to do your work so well that you are always ahead of the demands of your position. Our employers do not decide whether we shall stay where we are or go on and up; we decide that matter ourselves. Success or failure is not chosen for us: we choose them for ourselves.—H. W. Mabie.

Brownstone Bricks

2,000,000 at $16.00 f. o. b. Reading Sidings.

These are high grade pressed bricks, manufactured of crushed stone and hydrated lime. Greater crushing strength and lower absorption than burned clay. Uniform in shape and size. No soft ones. They are beautiful, economical and everlasting.

Red, Gray & Buff Face Bricks

A complete range of colors. Manufactured of vitrifying shale and fire clay. Our prices defy competition.

Straight Hard, Stretcher and Salmon Bricks

All Shale Bricks in carload lots, delivered on job at competitive prices. We are shipping 200,000 bricks daily to 28 building operations.

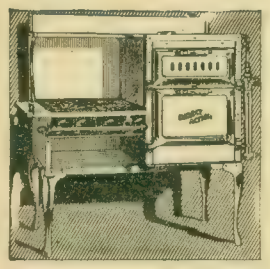
Prompt Deliveries from our Philadelphia Warehouse

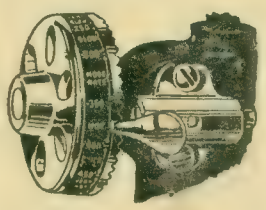


BUILDERS' SUPPLIES

To be assured of prompt deliveries of the best grades of

Cement, Lime, Sand, Gravel, Plaster, Concrete Stone and Pebbles

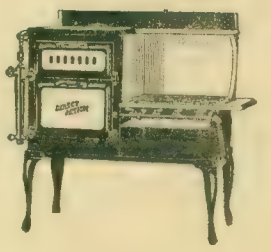
Place your orders with us. We have for years satisfied our customers. **WHY NOT YOU?**



P. H. FAIRLAMB CO. - **115 to 121 S. 30th Street Philadelphia**

One of the many "reasons why" so many homes in and near Philadelphia are being equipped with the

Direct Action Gas Range



is that its patented oven heat regulator eliminates all guess work in cooking and enables one to obtain the same results at all times. It SAVES GAS, TIME, FOOD and WORRY!

We have it connected up with gas on our sample floor and shall be glad to have you and your clients call any time to witness a demonstration. An attractive booklet showing the entire line is yours for the asking.

BORDEN STOVE CO., 1311-1313 Arch St., Phila.

The Touraine Apts, 1520 Spruce street; the Daniel E. Hogan Operations at 54th and Wynnefield avenue, and 60th and Columbia avenue; the William Pilton Operation at 5959 Larchwood avenue; and the Presser Operation at Yeadon, Pa. are a few of the many operations which are enjoying the advantages of the DIRECT ACTION GAS RANGE.

As The Editor Sees It

OUT of the great scarcity of all kinds of buildings today, the realization is dawning upon us that fire prevention methods are most worthy of consideration. It is often not until conditions arise which command attention that we awake to the seriousness of such situations as the great annual loss of life and property by fire.

At the present time property is valuable, labor is scarce and every possible means is being used to safeguard both. The campaign carried on by the National Board of Fire Underwriters through their bulletin, "Safeguarding America Against Fire," is bearing fruit, and people are realizing more and more the great need for adequate protection from the fire peril. According to the afore-mentioned bulletin, industrial fires in the United States are more frequent and more serious than is generally realized. Not only do they make up the largest portion of the total fire loss, since the average industrial fire will outweigh in damage a number of fires in dwellings, but they also include a shocking total of fatalities. These fatalities, of course, are almost entirely among the workers. The question of industrial fire peril thus becomes of vital importance to labor. Indeed, it is one of the subjects which labor organizations may well take up for serious consideration. It is also one of the subjects to which industrial and trade organization may accord quite as serious consideration. The viewpoint is opposite but the interest is mutual.

Labor risks its life when working under hazardous conditions. It can and should insist that premises be made as safe as conditions will permit. On the other hand, labor itself furnishes one of the chief causes of industrial fires. The ignorant or careless workman is a hazard to his fellows as well as to the plant in which he is engaged.

Labor thus has its plain rights in the matter of fire protection and its direct responsibility in the lessening of fire causes. One phase is physical, the other psychological, but both are essential.

The manufacturer, too, must not consider solely the financial aspect of industrial fires. It is even more important that he realize to what a great extent the lives of the operatives are dependent upon his care and oversight. He should never wait until compelled to make improvements; rather, he should take the lead in assuring to his workers the safety which they have the right to expect.

Industrial fires, like all others in which damage occurs, involve two factors; namely, the conditions which permit the flames to spread, and the original causes. In the first of these, the management is usually responsible; in the second, labor bears a large part. All told, the responsibility of the manufacturer outweighs that of the workman.

This matter is worthy of consideration at any time, but at the present moment, when the country is so greatly in need of speedy production, the importance of guarding against fire is far greater than ever before.

A recent issue of the Bulletin of the State Fire Marshal of Minnesota tells us that the charred remains of one year's fires in the United States would line both sides of a highway 1,000 miles long, and yet 80 per cent. of this is preventable.

A summary of the fire causes in various states shows that fires attributable to chimneys amount annually to from 10 to 26 per cent. of the total number in winter, the percentage has reached as high as 50. Especially in rural districts, where there are no organized fire-fighting agencies, builders should give unusual attention to the construction of chimneys that they may be made as nearly fire-proof as possible.

Chimneys should not be built on brackets; they should extend a sufficient distance above the roof, their walls should be at least 8 inches thick, flues should not be less than 64 square inches, the flueholes should never be filled with inflammable material and good flue linings of fine clay or terra-cotta should be provided. The cost of such lining in an ordinary two-story residence would be nominal.

With the present tremendous demand for new buildings and the consequent

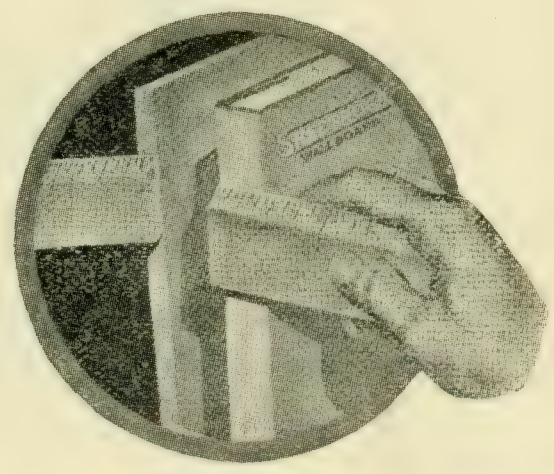
"TRIDENTS" FOR WATER, OIL, GASOLINE, BRINE, ETC., ETC.

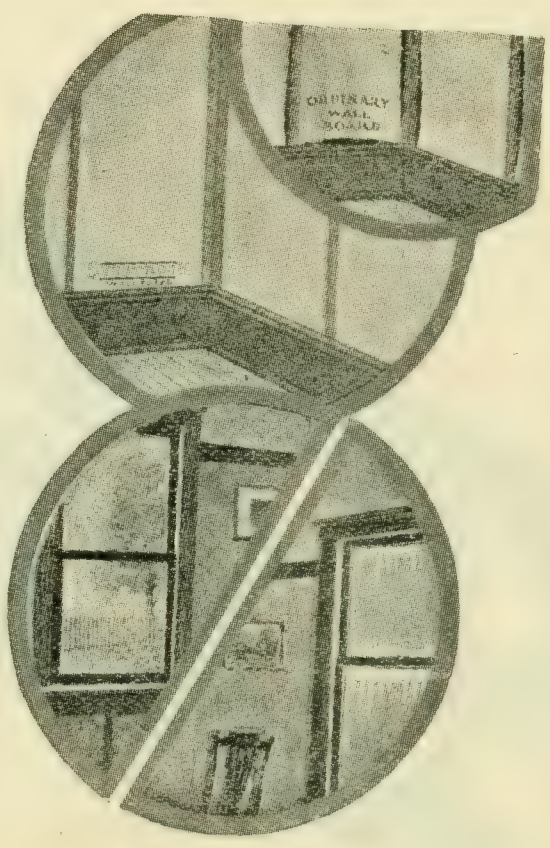
"TRIDENT" METERS

MORE TRIDENTS IN PHILA. THAN ANY OTHER MAKE

PHILADELPHIA METER CO., 942 Real Estate Trust Building.



BOTH PHONES



compare

With Any WALL Covering Made—

Sheetrock is more than wall board—it is better than wall board, for it is plaster in wall board form.

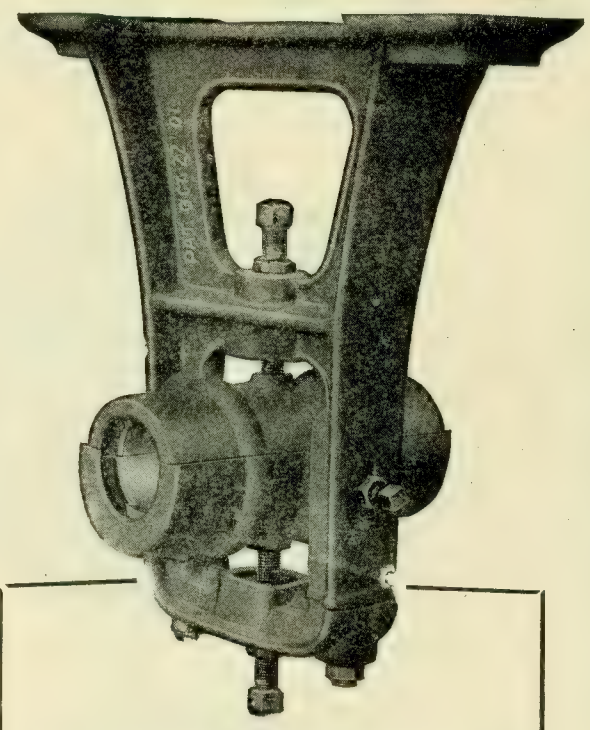
Made of fireproof gypsum rock, sandwiched between mineralized sheets of paper, Sheetrock provides just as safe a wall and ceiling covering as metal lath plastering.

Take samples of other wall boards and test them with a match. The result will show why Sheetrock was preferred by the U. S. Government for its army cantonments.

Compare Sheetrock in thickness with ordinary wall boards—it is nearly twice as thick. Try to break it, scratch the pure gypsum rock center, drive a nail thru it. Every test will prove the superiority of Sheetrock.

Sheetrock insulates heat and cold, for it is a non-conductor. Therefore it will save coal in winter and discomfort in summer—that means permanent satisfaction.

With Sheetrock you can overcome delays caused by late deliveries of material, by slow ripening and drying of plaster **and by** labor difficulties.



Sheetrock saves time and money.

LLOYD

Established 1868

What Builders Need

In their advertising merchants are apt to talk about goods—but listen to their *customers,* and nine times out of ten you will find that they are talking about *service.* It's the great force of modern business.

Lumber sold by different dealers is very much alike; but there is a great difference in *service.*

The best service you can get is none too good. When you build that new factory or store, the important thing is to choose the lumber dealer that will give you the prompt, efficient *service* that to builders so often makes the difference between failure and success.

Some day you will build. If you want the work finished on time, see that the lumber comes from LLOYD.

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Proposals

INVITATION FOR PROPOSALS.

Proposals for Construction and Alteration of Building, Picatinny Arsenal, Dover, N. J., January 12th, 1920. Sealed proposals will be received here until 1 P. M., January 27th, 1920, and then opened for constructing and finishing extension and alteration to Building 117. Further information upon application to Constructing Officer.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C.—January 16, 1920.—Sealed Proposals will be opened in this office at 3 P. M. February 16, 1920, for remodeling the United States Post Office and Court House building at Pittsburgh, Pa. Drawings and specifications may be obtained from the custodian of the building, Pittsburgh, Pa., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

BASE WAGES ON PRODUCTION

Lessened Output From Labor and Increased Pay Cannot Long Continue

By A. J. McKENZIE.
Vice-President, McKenzie Construction Company.

Belief that the time has come when some effective action should be taken to stop the general tendency toward the curtailment of output, is responsible for the formation of the Open Shop Association of San Antonio, which was organized a short time ago. It includes all employers of labor—contractors, manufacturers, hotel keepers, and merchants.

Since the pre-war days, the local wage scales have been greatly advanced, just as in all other sections. With higher pay came less production in many instances, and when still greater demands were made by the unions in some of the building trades, it was felt that a decisive stand should be taken to protect the public against an unjustified increase in wages. Accordingly, for the first time in the history of the city, the contractors of San Antonio organized an association, which after a thorough study of the matter adopted a resolution stating that "there is no just reason for an increase in carpenters' wages at the present time.

Contractors were not opposed to paying wages higher than those called for by the old scale—that was shown by the fact that even then many first-class carpenters were receiving more pay because they earned it. But they were unwilling to grant an increase affecting all carpenters alike, irrespective of their ability and output. The general decrease in production within the last two or three years was brought out in the resolution referred to above, in these words:

"The average daily records of all the general contractors show that the output of the average carpenter at $6.00 a day is approximately 50 per cent. less than his output when he was receiving but $4.00 a day; in other words, the average carpenter in July, 1917, at $4.00 a day, actually placed from 800 to 1,000 board feet of lumber a day, while at the present time at $6.00 a day the average daily output per man is only from 400 to 750 board feet."

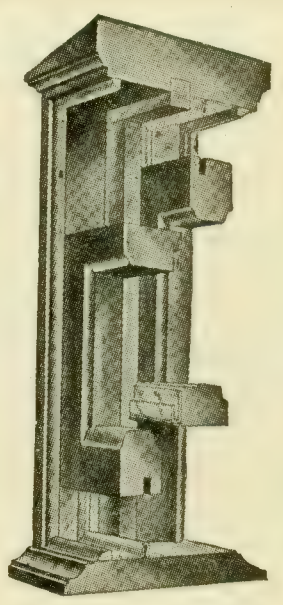
Later, the bricklayers and plasterers were called out in an attempt to force the contractors to sign an agreement to employ union men exclusively, but work was soon resumed on an open-shop basis. As a result, on one job the production was increased about 30 per cent. while the payroll was lessened.

In order to cope with the labor situation in an adequate manner an open-shop association was formed, in which all class of employers united. Already the movement has spread to several other Texas cities, and if this propaganda should be circulated throughout the entire country, I am confident the present unrest would soon be over.—*Bulletin of Associated General Contractors.*

"WHAT FOOLS THESE MORTALS BE."

An able honest man, if poor, is a damphool!
An able dishonest man, if "smart," is sometimes rich;
But while an able, honest man, if smart, should be rich, an
Able crook, however rich, is nothing but a damphool! WILLIS POLK.

When business is slow for some reason or other,—is the very time to advertise. When your car gets stuck on a muddy bit of road, you don't go and sit on the bank, —you push, to put it across. Do the same with your business.



The man with an order to place doesn't hunt you up in the city directory these days. He hasn't the time. If he can't find you in your trade magazine he can and does find somebody else, and that somebody else books the order.

"Facts are stubborn things." Advertise only the truth about your product and watch the result.

The impractical dreamers are not the architects, but the clients themselves, as a rule.

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

The man who doesn't advertise, these days, is forgotten. The world is too busy to look up dead ones.

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

You can't expect to do your "bit" of this busy world's business unless you enlist in the advertising ranks.

(Continued from Page 47.)

speeding up of work, especial care should be taken to prevent carelessness in chimney construction.

Along the same lines the National Fire Protective Association is pushing a vigorous campaign, emphasizing the present need of dwellings and the extreme necessity of protecting from the fire the homes we already have. It advocates care about matches, smoking, lighting and heating apparatus and gasolene, and urges a clearing out of rubbish, inspection of flues and cleaning of chimneys that sparks may not fall on combustible roofs.

* * *

PHILADELPHIA is not the only city which had a record building year in 1919. Nor is it alone in its crying need for homes—not of the palatial sort, but of the kind occupied by families living on a moderate salary or wage.

"Official records," says the *Chicago Herald and Examiner*, show more than 6,600 building permits in Chicago during 1919. The outlay involved is above $100,000,000. No previous year, except 1911 and 1916, reached these figures.

"If we deduct the months of the building strike last year's building record was the banner one in the city's history. The Fall months, after the big strike ended, were especially active, and 1920 promises to be the greatest building year of them all.

"It is like a welcome rain spell after a drought. The war paralyzed building operations, and the war no sooner ended than the building strike began. It will take some years of building activities to make up for lost time.

"Some citizens seem to forget that Chicago keeps on growing with a normal average of about 60,000 a year net addition to population. These people must live somewhere. Unless building keeps pace with population growth rentals are based on scarcity rather than intrinsic values.

"It is all right to take out building permits for new mammothe hotels, office buildings and factories. Here also the supply has run behind the demands. But Chicago's chief building shortage, as 1920 opens, is individual homes. Scores of new vast apartment buildings will only partially supply for places to live. There should be at least 10,000 new building permits this year for individual homes.

"Building material is high, and labor is high. But in the economic sky there is no immediate forecast for a reduction. Those who build now will build on a rising rather than a falling real estate market.

"In modern home building there is less building material and more art than there used to be. Bungalows are the fashion and they cost less than old style homes. Apartment life has trained most families to an economy of space.

"The main thing is to multiply individual homes, big or little, elaborate or cheap. The investment is sound. The independence of landlords is allurring. The added dignity of home owning is good for the average citizen."

FACTORIES AND THEIR FIRE PROTECTION

By Franklin W. Wentworth.

Architects and builders are slowly entering into a new phase of their accountability. Just as the architect, whose primary impulse is that of the artist, has been compelled in the interest of his clients largely to master the technique of the builder, so both the architect and the builder are now being called upon to protect their clients in the matter of the fire hazard. The enormous aggregate of the American fire waste, which contrasts us so unfavorably with European prudence, is beginning to cripple and impoverish us as the natural resources of the country, once believed to be inexhaustible, are ceasing to respond to the demands of our habitual extravagance. The common notion that the insurance companies pay the cost of fires is gradually giving way to an intelligent understanding of the fact that they are merely the collectors and distributors of the fire tax. They must recover from the public the sums they pay out in losses, plus the cost of conducting their business and a reasonable interest upon their capital. If they could not do this there would be no business of underwriting, and sufferers from fire would be relieved only by direct assessment upon their more fortunate neighbors. It is not certain that a year or two of such direct assessment would not be an admirable educative experiment. At present the cost of the fire tax is merged with everything we eat and drink and wear, and the masses of the people are ignorant of the fact that they bear it.

This is no longer true of the manufacturing classes, however. The manufacturer now realizes that he pays a tax directly related in amount to the character of the building he occupies and the nature of his manufacturing processes; and that in addition to this he pays for the carelessness of all his neighbors. If he cannot shift this burden by passing it along to the users of his product, merged quietly in the selling price of his goods, then he must pay it out of his profits, which cripples him in the competitive struggle.

The manufacturer now clearly sees this and expects the architects and builders he may employ to see it also. If, after his factory is completed, he finds that points respecting the fire hazard have been ignored and that in consequence of some structural qualification, now too late to alter, he is doomed to pay a fire tax which forethought, with perhaps no additional expense, might have avoided, he may be considerably disturbed by it.

Oftentimes structural defects (not mechanical, but from the standpoint of fire hazard) or the unwise location of hazardous factory processes cannot be overcome by the addition of special fire protection after the completion of the building. In such cases these defects operate as a fixed charge upon the property and contents as long as the building stands.

Fire protection engineering is coming to be a profession by itself, but, after all, its chief distinguishing quality is common sense. The principal demand is that the architect and builder should have a consciousness of the fire hazard, for up to this time very few of them have thought much about it. With the thought of the importance of this item in their minds no grievous blundering is possible, and technical advice on specific features can generally be had without charge from fire protection engineers in the service of the various underwriters' inspection departments having jurisdiction.

It is the intent of this article to set out certain fundamental principles which may serve as a basis of approach for those who have as yet given no thought to the subject.

Experience in fire protection engineering suggests three points to be kept in mind in planning a factory:

1. There should be as little combustible material as possible used in its construction and equipment.

2. Each floor should be absolutely cut

Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

off from every other floor and each section from every other section, so that fire may not communicate.

3. Every part of the factory should be equipped with fire extinguishing apparatus.

It is obvious that a factory of reinforced concrete will present certain advantages respecting the fire hazard over the slow-burning or "mill construction type; although the latter is preferred by many manufacturers as presenting more convenient surfaces for the attachment of pulleys, shafting and machinery.

Slow-burning construction is not undesirable if properly safeguarded and protected.

The advantages of the use of reinforced concrete appear when we consider that with such construction every floor may, by avoidance of vertical openings through it, be made practically a fire wall. The floors being incombustible a fire in any story may be ordinarily confined to that story. In the old type of factory, having open elevator shafts and belt openings from floor to floor, fire quickly ran from story to story, and was soon beyond the control of the fireman. It is essential that in all factories, of whatever type of construction, stairs, elevator and belts be placed in fireproof enclosures with openings to each floor protected by fire doors or shutters. If in addition to the omission of all vertical openings provision be made to drain the floors through scuppers set into the outside walls, the possibility of water damage to goods or materials on floors below is much lessened. The standard form of brick or concrete stair and elevator tower may also serve this purpose. If the building as a whole is of fire-resistive material it naturally presents less fuel upon which a fire may feed, and there is therefore less chance of a serious fire if for any reason the extinguishing agents are temporarily disabled. It must be remembered, however, that buildings are often destroyed by the burning of their combustible contents, and in all types of mills and factories the floor areas should be kept down to the minimum limit consonant with convenience and economic operation of the plant. These areas should be divided by fire walls, all openings in which should be protected by standard self-closing fire doors. These precautions minimize the danger of a rapid spread of fire horizontally. All mill-constructed buildings, if or large area, should be divided into sections by special fire walls extending above the roof and out beyond the walls of either side.

Whether exposed to possible fire from adjacent buildings or not, there should be no wooden frames or trim about the windows. Window frames should be of metal fitted with sashes of wired glass, for under strong draught fire frequently creeps up outside from story to story by means of the windows, consuming the wood trim and igniting contents of the building on each floor. Metal window frames are now so constructed that they will stand very considerable exposure to fire without buckling or releasing the glass, and their liberal use in all varieties of buildings is greatly to be desired. The sashes may be operated as conveniently as those of any other window.

It will be observed that all the suggestions made for fire walls, stair and elevator enclosures and window openings are as applicable to buildings of mill or slow-burning construction as to those of concrete. They should be followed, as far as possible, in all factory construction and in mercantile buildings as well.

In certain buildings of mill construction, carrying stocks of excessive weight, it has been a common practice to make the main beams of two pieces of timber side by side, bolted together. An air space between the pieces was formerly advocated in behalf of better seasoning and possible avoidance of dry rot. Experience has demonstrated, however, that this space not only reduces the resistance of the beams to fire by offering almost double the wooden surface to its attack, but that in case of fire getting started the space between the beams holds it for a long time and prevents its extinction.

It is obvious that neither automatic sprinklers nor ordinary hose-streams can successfully reach fire lurking in such narrow alleys. Such construction should be avoided.

Mill or slow-burning onstruction presents its own inherent problems. Enough wood must be used to insure strength and stability, but superfluous wood should be avoided. It matters very much as to just how the quantity of timber used may be disposed.

The guiding thought of the architect should be to present to fire attack the least practical amount of wood surface.

For example, a mill planned with heavy beams 8 to 11 feet on centers of continuous spans from wall to post or post to post of from 20 to 25 feet is infinitely more desirable than one of miscalled mill construction having longitudinal girders resting upon posts on which girders are placed four feet or less on centers. The latter construction not only adds to the exposed wood surfaces which may be attacked by fire, but the disposal of the timbers obstructs the action of sprinklers and prevents the sweeping of hose streams from one side of the mill to the other.

No architect with the consciousness of the fire hazard will ever plan for either manufacturing or mercantile occupancy those undesirable fire boxes known as "light-joisted" buildings. Light joists or rafters two or three inches in width, spaced from ten to sixteen inches on centers, ignite and burn like kindling. Their numerous corners furnish projections for easy ignition. The menace of such construction may be aggravated by sheathing under the joists. This provides a series of wooden cells, pervaded with concealed spaces in which fire may riot and lodge and dodge extinguishment until the floor or roof is burned through. By the same token partitions of light wood should be avoided.—*Building Industry.*

* * *

Fire insurance rates in Kansas City, Mo., advanced between 20 and 25 per cent. according to the *Kansas City Star* which quotes the Missouri Inspection Bureau on the subject.

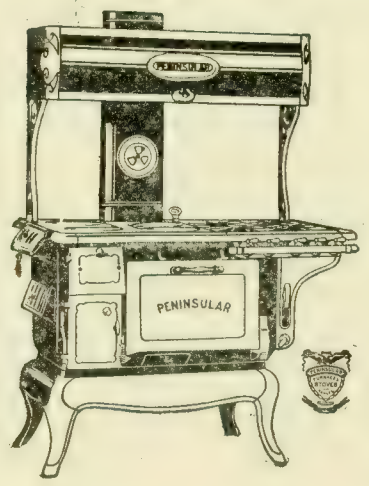
As one reason for the increased rates, attention was called to the fact the cost of repairing partly destroyed buildings had been advanced.

The new rates apply principally to these classes of insurance property:

Brick or stone dwellings, from 25 to 25 per cent.

Ordinary brick buildings, 17½ per cent.

Household goods, 20 to 25 per cent.



Officials said there would be no increase in the rate on fireproof buildings or where sprinkler systems are installed. The fire hazard in Kansas City has been reduced in the last year due to the betterment in fire fighting equipment, it was said. Inspectors, however, deplored the lack of an automatic fire alarm system found in most cities. Missouri, it was pointed out, is one of the few States without a fire marshal.

RITCHER-LEE CO.

The offices of A. A. Ritcher and H. I. Eiler, associate architects, Reading, Pa., and W. H. Lee, architect, Philadelphia and Shamokin, Pa., will be combined and operated under the firm name of The Ritcher-Lee Co., architects and engineers, for the practice of architecture, engineering and building construction, with offices at 32 South Seventeenth street, Philadelphia, and Sixth and Court streets, Reading, Pa.

The new organizataion will be in a position to render prompt and efficient service in connection with the design and constrution of all types of buildings.

The only road to advancement is to do your work so well that you are always ahead of the demands of your position. Our employers do not decide whether we shall stay where we are or go on and up; we decide that matter ourselves. Success or failure is not chosen for us: we choose them for ourselves.—H. W. Mabie.

A Few of the Reasons

why you should install the **Peninsular Combination Range:**

A Range that burns either Gas, Coal or Wood without any changing or removing of parts—separate or both at the same time—whose oven is always ready for instant use.

A Range that takes up no more space than an ordinary kitchen range, bakes and broils perfectly under all conditions and gives a lifetime of such service.

A Range that makes the kitchen cool in Summer, warm in Winter—beautiful in design, substantial, and easy to keep clean. Secure our prices.

Brownstone Bricks

2,000,000 at $16.00 f. o. b. Reading Sidings.

These are high grade pressed bricks, manufactured of crushed stone and hydrated lime. Greater crushing strength and lower absorption than burned clay. Uniform in shape and size. No soft ones. They are beautiful, economical and everlasting.

Red, Gray & Buff Face Bricks

A complete range of colors. Manufactured of vitrifying shale and fire clay. Our prices defy competition.

Straight Hard, Stretcher and Salmon Bricks

All Shale Bricks in carload lots, delivered on job at competitive prices. We are shipping 200,000 bricks daily to 28 building operations.

Vitrified Paving Bricks

Standard specification pavers at lowest market price.

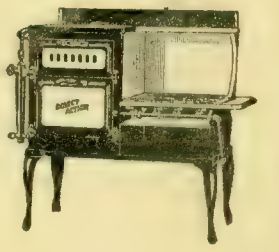
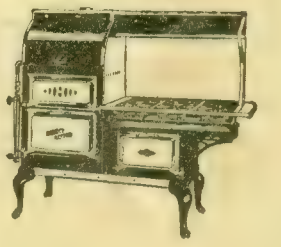
One of the many "reasons why" so many homes in and near Philadelphia are being equipped with the



Direct Action Gas Range



is that its patented oven heat regulator eliminates all guess work in cooking and enables one to obtain the same results at all times. It SAVES GAS, TIME, FOOD and WORRY!

We have it connected up with gas on our sample floor and shall be glad to have you and your clients call any time to witness a demonstration. An attractive booklet showing the entire line is yours for the asking.

As The Editor Sees It

SO much has been said during the last year about the great part which the construction industry must play in supplying the needs of the country for new buildings, that the subject at first thought would seem well nigh exhausted. We are told, however, that approximately 1,000,000 homes are needed in the United States *now,* and the problems relating to supplying this demand are still unsolved.

One thing is certain—co-operation is of the utmost importance. In a recent issue of the GUIDE we suggested "closer contact between all the organizations and agencies entering into the planning and costructing of buildings," in order to promote "greater opportunity for the realization of efficient service in the great building projects which are upon us."

Along this same line of thought comes the message delivered by Charles Wm. Bernhardt, President of the National Association of Builders' Exchanges, at the annual convention held recently in Indianapolis. In enumerating the difficulties ecountered by his administration, Mr. Bernhardt continued:

"Your administration found new conditions facing them. The former normal conditions had passed away and what had formerly been considered fair prices for the various times entering into the construction of our buildings were not even accepted for consideration. All quotations were made subject to immediate acceptance, deliveries to be made when possible. If shipments were promised within a given time, strikes and railway delays made it impossible in nearly every instance to carry out these promises.

Labor agreements were worse than useless, for they only served to confuse the mind, as an agreement was scarcely entered into before it was broken. In many instances the organizations denied any participation in these violations, claiming individual action on the part of its members.

In many instances employers have permitted themselves to be misled by their employes who have claimed they had offers of higher wages, either from other employers or elsewhere. In many cases this scheme was successful, as each employer felt that it was important that his work proceed without interruption, overlooking the fact that the increase in the price paid for labor did not increase the supply. Better results would have been obtained had the employers met occasionally to discuss the conditions that confronted them.

I have found that in several of our member exchanges the custom of holding weekly meetings has been established. This custom affords an excellent opportunity for the exchange of ideas and the rectifying of the evils that constantly creep into our business.

Unsettled conditions have made it impossible to complete operations undertaken with any degree of efficiency as was formerly in effect. This has not only been unsatisfactory to the owner, but it keeps the capital invested by those interested in its erection for a much longer period.

One of the most vital questions that has occupied the time of your board during the year, and which has had a great deal to do with the present dissatisfaction, is the question of jurisdictional disputes.

The National Institute of Architects, through Mr. E. J. Russell, its chairman, undertook to bring about a conference for the purpose of inaugurating a movement which had for its purpose the creation of a national board of jurisdictional awards, to which all questions of trade jurisdiction should be submitted for action and decision. In accordance with the desire expressed by the convention in Milwaukee, after the request for a representative from this organization had been made by Mr. E. J. Russell of the American Institute of Architects, Mr. E. W. Raugh was appointed to represent this association.

Two conferences were held, one in Cleveland and one in Indianapolis. At the latter meeting Mr. Reaugh was assisted by Mr. C. Pierson. Rules were formulated at these conferences for the guidance and regulation of the proposed national board of jurisdictional award, which was to be composed of one repre-

BLUE PRINT

sentative each from the American Society of Engineers, the Associated General Contractors, the National Association of Builders' Exchanges, one from the National Association of Building Trades Employers, then in process of formation, and three representatives from organized labor. These proposed rules were submitted to the Board of Control for consideration. The Board of Control, after making some revisions, felt that it was a matter that should be acted on by the members. Therefore, it was decided to submit it to a referendum vote. The result of this vote was submitted at the board meeting held in Baltimore. After canvassing the vote the board decided that it was not a fair expression of sentiment and decided to refer the entire matter to the convention. As the matter will be presetned to you in the form of a report by Mr. Reaugh, I leave the matter for your consideration at that time, without comment other than to express the hope that some solution will be found that will relieve the industry of this problem and the intolerable situation it creates.

The committee created at the last convention for the purpose of forming a national Association of Building Trades Employers has done most excellent, as is evidenced by the organization itself. I do wish to call attention, however, to its main features and possibilities. In the development of this new organization due consideration has been given to the varied conditions with which our people come in contact in their respective localities. While in some sections agreements are entered into between employers' associations and the building trades councils, there are also large areas where open shop conditions prevail. The National Association of Builders' Exchanges has ever recognized the right of home rule and has ever stood ready to protect its member associations in the preservation of the policy they choose to live and work by. In the National Association of Building Trades Employers an opportunity is offered to determine the possibility of acting for and in behalf of all employers of labor in the building industry, irrespective of the policy pursued, in the employment of their labor. This organization must choose for itself broad, patriotic principles if they hope to succeed, for by example and precept it must teach labor to broaden its vision, create for itself freedom from petty jealousies and class prejudices.

It is just as much the interest of labor that the cost of living be reduced, that buildings be more economically built, and that the various items that enter into a ...ng be more efficiently assembled, as ... of the employers. From this en... ment of co-operation between employer and employee, each striving to economize in the cost of production by a more efficient execution of the enterprise in which they are engaged, must come the encouragement to those who have capital to invest, and from that investment the assurance of the prosperity of the Nation. We are living in a new era. New conditions have arisen which require new lines of thought and more active endeavor, to the end that all of our people may be benefited. This new organization should act in harmony with our older experience and unite itself with the National Association, so that the greatest benefit may be derived from concerted action. This can be done by affiliation, with representation on the Board of Control. In fact, I so strongly favor such a movement that I feel that all National organizations should unite under one head, preserving their organization intact, but having representation on the Board so that all National questions may be handled jointly for a common interest. This plan is perfectly feasible and can be worked out by a strong committee appointed for this purpose. Such an organization will not only command the respect and confidence of the entire public, but would discontinue the present overlapping of effort that is now so evident. I commend this thought to your earnest and careful consideration.

This subject, as in years past, has been given a great deal of thought and attention. In the death of Mr. Frank Miles Day of the American Institute of Architects, the architects not only lost an able member, but this association lost a valued friend. Mr. Day had given this subject a great deal of time and thought, which proved a very valuable assistance in the solution of this problem.

The American Institute of Architects has appointed Mr. William Stanley Parker of Boston to fill this vacancy.

Mr. Parker has submitted, through Mr. King, our counsel, his version of the "Cost-Plus" form of contract. This, together with the criticisms of Mr. King, have been forwarded to Mr. Reaugh, chairman of this committee, who will make a detailed report on this subject.

This is a very important subject and the work accomplished in the perfection of these documents deserves better support than it has received in the past. If they were put more generally into practice, the membership would receive a lasting benefit. I can only urge the importance of a more extensive use of these documents.

Your Legislative Committee has been actvie throughout the entire year. They have favored all legislation that has been in the interest of the building industry, and opposed all matters that have been unfavorable.

It occurs to me that this organization should be more keenly alive to its possibilities in this respect. We have, however, been limited in our activity by a lack of funds, which forces us at all times to depend on those who are willing to give their time to this work without hope of reward.

I have always felt that we should not content ourselves with merely passing our opinion on measures as they are introduced. But we should express our disapproval of measures now on our statute books that are not for the best interests of the public generally.

The American Federation of Labor is always on the alert, injecting wherever possible its ideas and wishes.

Eternal vigilance is the price of liberty. If we wish to retain industrial freedom, we must become actively interested in the affairs of our states and nation.

This is the Ninth Annual Convention. Surely in this time you have been able to determine in your own minds the possibilities of an organization that has for its purpose the uniting of all interests in the building industry.

* * *

PAYMENT FOR ESTIMATING.

Every contractor is entitled to receive adequate payment for his work or services. None can long survive in business or make a fair living profit out of it, if they do not include their overhead or operating expenses in their bills or charges for work and in their estimates or bids for a job.

Estimating the cost of a piece of work, or preparing a bid for the construction of a building, requires more or less labor, time and outlay of money, to say nothing of the application of the estimator's or bidder's technical or practical knowledge, acquired perhaps through years of study and experience.

"Estimates cheerfully furnished" has for years been a pitiable cry for business of some contractors. Of course, contractors should furnish estimates cheerfully and conscientiously, and they should also be able to do so competently, but in any case they should be entitled to and should charge for their services if asked or permitted to submit an estimate.

Every job figured upon should bear the cost of its own estimating expenses. These should not be carried forward to some future, prospective, uncertain job. No contractor who, let us say, has bid unsuccessfully on a dozen jobs, can hope to be reimbursed for his entire overhead expense for these jobs by waiting to unload the same on some other owner whose job he may possibly, eventually land. If he so expects, he'll either never get that

(Continued on Page 82.)

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

BEIDLER & BOOKMYER
424 Walnut Street, Philadelphia

New York Office, 95 William Street

SHEETROCK
WALL BOARD

Sheetrock Saves Time—Labor—Material.

Plaster in wall board—that is **Sheetrock.** The pure gypsum rock center is the scratch coat of plaster, the mineralized paper coverings the finishing coat.

Sheetrock saves time for you, saves the long waiting for the ripening of plaster before it is ready to apply, and saves the long drying wait in all coats.

Sheetrock saves labor for **Sheetrock** is nailed on by your own men—in a jiffy. Saving labor today means real saving in time, money and anxiety.

Sheetrock saves material for **Sheetrock** is much cheaper in cost than plaster and labor.

You will find that **Sheetrock** gives permanent satisfaction. It will never warp, bulge or crack. And it takes any kind of decoration, so that a home can be made as artistic with **Sheetrock** as with plaster without the limitation of plaster.

LLOYD

Established 1868

Plans or No Plans

There are two classes of builders who need the help of a strong, modern lumber centre,—those who have *planned* their operations well, and those who haven't.

If you have planned well, you will need a strong organization to help carry out your plans. The best is none too good. In big building operations, all of our experience and resources, including the powerful aid of our Traffic Department, are constantly required.

But if you have *not* been able to make careful plans; if you are forced to build hastily and under pressure, then only an uncommonly strong organization will enable you to accomplish your purpose. When you need unusual stocks or service that you have no right to expect, then the resources of the LLOYD organization will often save the day for you.

Some day you'll build. If you want the work finished on time, see that the lumber comes from *LLOYD.*

WILLIAM M. LLOYD COMPANY

Home, Delaware avenue, Washington street and Eleventh street, Wilmington, Del. Owners, Benevolent and Protective Order of Elks, Wilmington, Del. Size of lot, 108⅛x73½x87x35 feet. Cost about $260,000. Building to be 6 stories. Building Committee receiving competitive plans. Advisor to committee, Warren P. Laird, University of Pennsylvania, Philadelphia. The following have been invited to submit plans by February 28th: DeArmond, Ashmead & Bickley, Franklin Trust Building; Zantzinger, Borie & Medary, Otis Building; Paul A. Davis, 3rd, 1713 Sansom street, Philadelphia; Brown & Whiteside, du Pont Building; John D. Thompson, Ford Building, and E. L. Rice, 815 Market street, all of Wilmington, Del.

Bridge, over Brandywine River, Wilmington, Del. Engineer, B. H. Davis, 17 Battery Place, New York City. Owners, Washington Street Bridge Commission, care of Frederick W. Carpenter, Municipal Building, Wilmington, Del. Lowest bidders: Bush, Roberts & Schaeffer, New York City, $802,000; Snare & Triest, Philadelphia, $818,523.

(Continued from Page 68.)

coveted job, or, if he does, he'll not make much of a profit out of it over and above his accumulated expenses, especially if he secured the job because he happened to be the "fortunate lowest bidder." And, by-and-bye, his overhead account, constantly piling up, will swamp him.

A movement started several years ago in the East to secure payment for estimating has resulted in the organization of the National Contractors' Association, Inc., with a membership now estimated approximately at from 5,000 to 6,000. In Wisconsin there are a large number of contractors in many of the principal cities, such as Milwaukee, Madison, Sheboygan, Green Bay, Oshkosh, Racine, Janesville, etc., who have adopted the plan and who are charging for estimating and are being paid for the same. No self-respecting owner or architect will ask a competent contractor to devote his time and experience to the preparation of an estimate without expecting to reimburse him for his services. And no cautious owner will give as much as three whoops for the "estimate" of an incompetent bidder. He has the privilege of selecting his bidders, and if he must pay for estimating he will exercise that privilege, the result of which will be to eliminate a number of irresponsible bidders, thus placing on a more satisfactory and legitimate basis the entire process of receiving bids and letting of the contracts.; the performance of the work; the supervision of the same by the architect; the settlement of questions in dispute; the interpretation of plans and specificaions; the payment by the owner as the work progresses, and the final settlement of all accounts for labor and material furnished. Even when six or eight of the most competent and conscientious bidders have prepared their estimates upon the identical set of plans and specifications it is no hazard to assert that there will be a considerable difference between the highest and the lowest; and if in such case the contract is given to the lowest one the probability of his skinning the job wherever possible is little to be feared, and an owner who therefore is assured of good work and the lowest reasonable cost can well afford to pay for the cost of estimating, which, according to the established rates, will average less than one-tenth per cent. of the cost of the job.

Architects, better than anyone else,

Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

know of the danger, the annoyance, the certainty of getting poor work in spite of the most careful supervision, if the contract is let to some of the lowest bidders in cases where a large number of all kinds of more or less able contractors have been permitted to "put in" a bid. For that reason, if for none other, every reasonable architect is in favor of the payment for estimating, although some of them are slower than others in approving of the proposition. However, as the present prosperity wave will cause and necessitate an enormous amount of new building, and as contractors are unable with the scant supply of mechanics and laborers to take more than a limited amount of work, it would seem but natural that they would prefer to figure mainly with architects who favor the payment for estimating plan, and who are not afraid, for petty cash or selfish reasons, to tell the owner of the plan and also tell him that contractors cannot afford and do not care to bid on jobs on which they are not to be paid for estimating.—*Wisconsin Builders' Bulletin.*

LIABILITY OF ARCHITECT TO OWNER ON BUILDING PLANS

The question of the liability of the architect to the owner is one which has been threshed out in the courts from time to time but is nevertheless one of recurring litigation because no general rule has ever been laid down by the courts that will cover every specific case. About the only thing that has been universally and finally established is that the architect is human and his work can therefore only approximate perfection, however skillful or learned he may be; hence the owner cannot expect absolute perfection in either plans or specifications. Reviewing opinions of many courts regarding the liability of the architect to the owner a legal authority, writing for the *American Contractor,* says:

It is a general rule of law that the architect must employ reasonable skill and taste in his work. The term "reasonable," of course, being rather vague, but it is presumed to mean reasonable among his profession.

In a Nebraska case it was held that, as between the architect and the owner, no doubt the architect would be liable for any mistake in the plans and specifications which increased the cost of the building.

In New York it was held that the architect cannot recover anything where defects and omission run through the entire system of his plans, so that they are useless to contractors and builders.

In a Pennsylvania case, the referee took as a basis of ascertaining the value of the services of an architect, their value if they had been skilfully prepared and complete, and deducted from the amount what it would cost to complete the plans and remedy the defects.

This decision was reversed on appeal, the court saying:

"If the plans had simply been incomplete, requiring only the services of an ordinary draughtsman to perfect the details, the basis adopted by the refereee would not have been subject to just criticism. When an architect undertakes to prepare the plans for a large and expensive structure, he covenants not only that he is possessed of the requisite skill, but that skill shall be exercised in the work he had undertaken.

"If the product of his labor is a plan vitally defective, his employer might go on and erect a building enormously expensive which, from its foundation up, would be insecure.

"It is manifest that the value of a plan skillfully drawn furnishes no standard by which to ascertain the value of a plan containing such radical defects. A plan which, if carried into execution, would produce a building not self-supporting, can hardly be said to come up to what is expected of an architect.

"If the plan in question exhibited the skill which the nature of the employment demanded its value was to be estimated accordingly. If it was so defective as not to meet the requirements of the purpose for which it was intended, it might be utterly worthless. If the plaintiff was entitled to recover, the value of his services is to be determined by what he himself did, and not what some more careful man might have done."

In a New York case, the court said:

"It is as necessary that the architect should know what is needed to make steam heating apparatus serviceable as it is that he should know how sewer gas is to be kept out of the house. No one would contend that at this day an architect could shelter himself behind the plumber, and excuse his ignorance of the ordinary appliances for sanitary ventilation by saying that he was not expert in the trade of plumbing.

"He is an expert in carpentry, in cements, in mortar, in the strength of materials, in the are of constructing the walls, the floors, the staircases, the roofs, and is in duty bound to possess reasonable skill and knowledge as to all these things; and when, in the progress of civilization, new conveniences are introduced into our homes, and become, not curious novelties, but the customary means of securing the comfort of the unpretentious citizen, why should not the architect be expected to possess the technical learning respecting them that is exacted of him with respect to other and older branches of his professional studies?"

It must be kept in mind, however, that the duty of the architect, with reference to a certain engagement, is limited by the contract which he has entered into with the owner. The law cannot impose a liability even as to skill and knowledge, which is not contemplated by the contract. And where certain specifications are set out in the contract, tending to point out the measure of the architect's duty, it will be construed by the courts to mean a reasonable skill in the particulars mentions and nothing greater.

It is further a general rule of law that an architect is not duty bound to keep secret the plans for a given building, unless he has specifically contracted to do so. But where an architect is engaged to prepare plans for a given building and he, as is generally customary, gives out the fact to the newspapers, he has violated no duty at law which will render him liable in an action for damages, even though the disclosure of the secret may be decidedly injurious to his employer.

It is also true that the architect cannot be held responsible, in an action for damages, for injuries or losses sustained which are the result of the owner's own fault.

For instance, in a given case, the city ordinance prohibited buildings placed nearer the street line than a certain distance. The architect informed the owner of this provision in the ordinances. The owner, however, wanted the building placed on the line and then decided to have it built with windows which projected over, nearer the street than allowed by the ordinance.

The city promptly sued the owner for damages and also obtained an injunction against him, making him tear out the windows and build them in accordance with the statute.

The owner then attempted to recover damages from the architect, but the court disallowed the claim, saying that the architect could never be held responsible for the losses sustained by the owner which were the result of his own fault. The architect had drawn the plans correctly in the first instance and he had warned the owner of the existence of the ordinance. Hence, his hands were clean of the matter.

The impractical dreamers are not the architects, but the clients themselves, as a rule.

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

The man who doesn't advertise, these days, is forgotten. The world is too busy to look up dead ones.

Brownstone Bricks

2,000,000 at $16.00 f. o. b. Reading Sidings.

These are high grade pressed bricks, manufactured of crushed stone and hydrated lime. Greater crushing strength and lower absorption than burned clay. Uniform in shape and size. No soft ones. They are beautiful, economical and everlasting.

Red, Gray & Buff Face Bricks

A complete range of colors. Manufactured of vitrifying shale and fire clay. Our prices defy competition.

Straight Hard, Stretcher and Salmon Bricks

All Shale Bricks in carload lots, delivered on job at competitive prices. We are shipping 200,000 bricks daily to 28 building operations.

Vitrified Paving Bricks

Standard specification pavers at lowest market price.

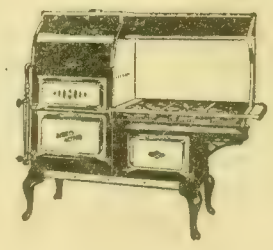
One of the many "reasons why" so many homes in and near Philadelphia are being equipped with the



Direct Action Gas Range

is that its patented oven heat regulator eliminates all guess work in cooking and enables one to obtain the same results at all times. It SAVES GAS, TIME, FOOD and WORRY!

We have it connected up with gas on our sample floor and shall be glad to have you and your clients call any time to witness a demonstration. An attractive booklet showing the entire line is yours for the asking.

BORDEN STOVE CO., 1311-1313 Arch St., Phila.

As The Editor Sees It

JOHN IRWIN BRIGHT, Chairman of the Committee on Community Planning, American Institute of Architects, finds the Senate Report of the U. S. Housing Corporation inaccurate and audacious. The report accusing the Housing Corporation of lack of speed is ludicrous when the delays of over a year caused by Congress talking about houses before making provision to build them are so fresh in our minds.

"The United States Housing Corporation," writes Mr. Bright, has been severely arraigned by an investigating committee of the United States Senate in its report of December 16, 1919.

The corporation is a government agency created for the purpose of providing houses for workmen engaged in war work and an appropriation of $100,000,000 was placed at its disposal.

It might be well to state at the commencement of these remarks that for many weary months after we had definitely cast our lot with the Allies, Congress could not be brought to believe that good housing could favorably influence industrial production. This conviction remained with it in spite of all evidence to the contrary. The far-seeing enterprise of the American Institute of Architects in exhaustively collating and publishing the result of England's experience on these lines had no perceptible reaction on the minds of our congressmen.

War was declared on Germany on April 6, 1917, and it was not until July 25, 1918, that the Housing Corporation was legally permitted to disburse funds. Fifteen and one-half solid months devoted to "talking it over."

In the face of its own record the Senate now passionately accused the Housing Corporation of lack of speed. The audacity of these tactics almost compels respect.

The report omits to say that while awaiting governmental authority, Mr. Eidlitz, later the president of the Housing Corporation, and several architects made themselves financially responsible for very large sums of money in the preparation of the task that they felt sure, sooner or later, had to be undertaken. It is easy to see that the creditable action of these men could not be noticed by the Senate without considerable embarrassment to itself, and therefore, the very interesting prenatal history of the Housing Corporation is passed over in silence.

The report, in so far as it assails the policy and the personnel of the Corporation, is of little interest. Most of the accusations deal with inefficiency and faults of judgment, characteristics of all our other war organizations improvised over night. Small wonder that the machine creaked and groaned.

It would be quite fruitless to review the senatorial report for the purpose of pointing out its errors, but, without wishing to be controversial, there can be brought into relief several misstatements of the investigators of a magnitude which renders questionable all of their conclusions.

It is asserted that if work on the 649 government dwellings in Philadelphia had ceased on armistice day the loss would have been only $425,000, but as they were completed and are now occupied the loss has been $1,500,000. The first half of this statement is possibly true, but the claim of a $1,500,000 loss is based upon a guess, not an appraisal, and is grossly inaccurate. It is a matter of lommon knowledge that not only houses of this description cannot be built in Philadelphia today below the price which the senators say these houses cost, but that each and every one can readily be sold for a figure above this price whenever the government chooses to relinquish control. Under these conditions the arithmetical deductions of the committee are not intelligible.

The architects on this project received for their total remuneration less than seven-tenths of 1 per cent. of the cost of construction. This fact could easily have been ascertained by the committee before writing its ill-informed remarks on architectural fees.

The allowance to the architects in general of 100 per cent. of drafting expense

BOTH PHONES

A Section of the Barrett Specification 20-Year Roof on West Technical High School, Cleveland, Ohio It was laid over another type of roof that had begun to deteriorate after only seven years of service.

How to be sure of a 20-Year roof—

THE West Technical High School, Cleveland, Ohio, pictured above, has just been re-roofed with a Barrett Specification Roof *over another type of roof that had begun to deteriorate seriously after only seven years of service.*

When the Barrett Specification Roof was finished we handed the City Officials of Cleveland a Surety Bond, issued by the well-known United States Fidelity & Guaranty Co., of Baltimore, which *guarantees* the roof to last for at least 20 years without maintenance expense of any kind. The probabilities are that this roof will last nearer 30 years.

There is only one way to be absolutely sure of getting the kind of roof you want—a genuine Barrett Specification Roof—and that is to write this standard paragraph into the building specifications:

> "The roof shall be laid according to The Barrett Specification dated May 1, 1916, and the contractors shall obtain for us, without additional cost, the Barrett 20-Year Guaranty Bond."

This simple paragraph takes all the gamble and worry out of roofing, for both owner and architect.

Such expressions as "Barrett Specification *type* of roof," "Five-ply felt-and-pitch roof" or "Barrett Specification Roof, *or equal,*" should never be permitted in a building specification.

The 20-Year Surety Bond Is Free

The 20-Year Surety Bond will be furnished on any roof of 50 squares or over, in cities of 25,000 or over, or in smaller places where Barrett Inspection Service is available. There is no charge for this Bond. Our only requirements are that the Barrett Specification shall be strictly followed and that the roofing contractor shall be approved by us.

A copy of the Barrett 20-Year Specification, with roofing diagrams, sent free on request.

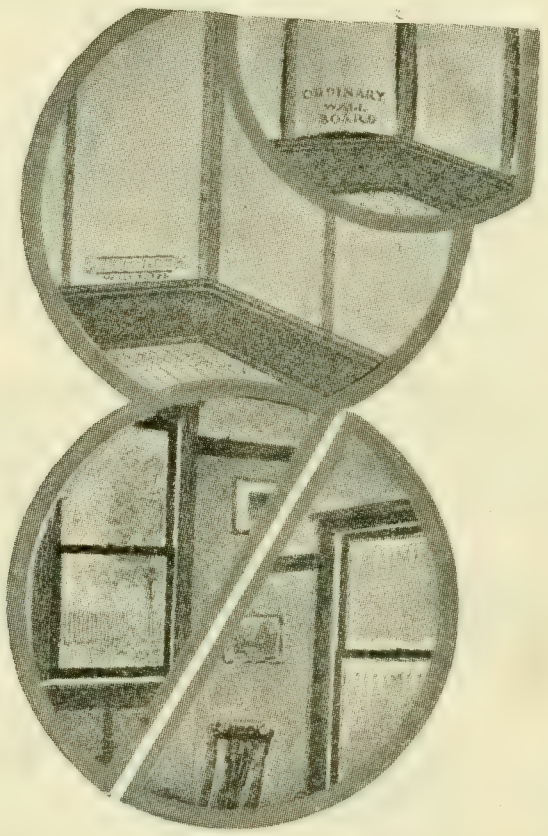
SHEETROCK WALL BOARD

Insulates Heat and Cold

The purpose for which a building is constructed —to offer shelter—is realized or not, depending on the protection from winter's wind and summer's heat which the structure offers.

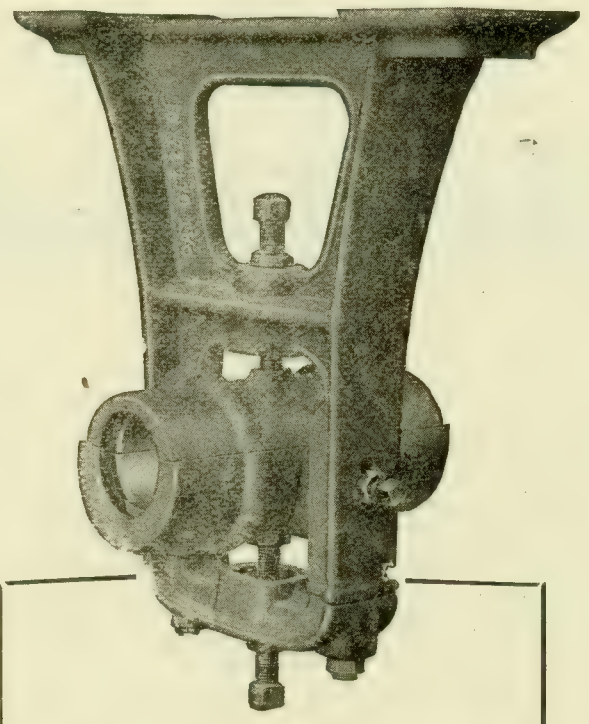


And protection depends on insulation. No matter how well built a home is, unless the walls keep out cold and heat that home is not serving its primary purpose.

SHEETROCK, the plaster in wall board form, offers the best insulation available. Made of pure gypsum rock and manufactured so as to be easily handled, SHEETROCK is plaster substitute par excellence.

SHEETROCK provides an attractive surface that takes any kind of decoration.

SHEETROCK improves appearances, cuts costs, saves coal bills and makes homes comfortable both summer and winter.



Write for SHEETROCK Catalogue.

What Builders Need

Established 1868

In their advertising merchants are apt to talk about goods—but listen to their *customers,* and nine times out of ten you will find that they are talking about *service.* It's the great force of modern business.

Lumber sold by different dealers is very much alike; but there is a great difference in *service.*

The best service you can get is none too good. When you build that new factory or store, the important thing is to choose the lumber dealer that will give you the prompt, efficient *service* that to builders so often makes the difference between failure and success.

Some day you will build. If you want the work finished on time, see that the lumber comes from LLOYD.

WILLIAM M. LLOYD COMPANY

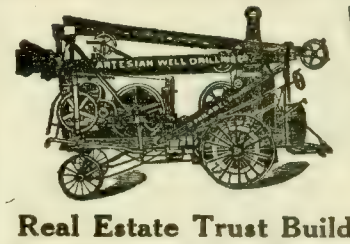
Locker House, Edge Hill, Pa. Architect,

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.



Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

Proposals

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., January 31, 1920.—Sealed proposals will be opened in this office at 3 P. M., March 29, 1920, for the construction of the United States Post Office and Custom House at Apalachicola, Florida. Drawings and specifications may be obtained after February 16, 1920, from the custodian of the site at Apalachicola, Florida, or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from Page 87.)

as overhead is made much of, but, while hinting darkly at scandal, the buck is passed to some officer of the law who is invited to prove the case. The cautious form of the accusation is quite understandable, for the senators only published half of the evidence. Overhead was allowed only when draftsmen were working in the office on the preparation of the plans. As soon as construction was commenced the draftsmen were dispensed with and no more overhead was allowed, but the office expense nevertheless continued until the work was entirely finished. Under this arrangement the angle of incidence was balanced by the angle of reflection, and during the later period of the life of the contract the architect was always working at a serious loss. I submit that no real profiteer would agree to such an arrangement.

That Mr. Eidlitz, as president, was guilty of every act of omission and commission specified by the honorable senators may be accepted, and yet the outstanding fact remains that these houses and towns represent one of the most valuable physical by-products of the war. The salvaging of both the idea and the material expression of the idea is the part of statesmanship. Indeed, the mandate to the committee was to report on the maintenance, the location and a plan for future disposition of these groups of dwellings. But disregarding their instructions they devoted their entire time to minimizing the value of what has been accomplished.

There is constant evidence of ill temper throughout the report. The very fact that these houses are beautiful, that they are well arranged, individually and in groups, that they are light and healthful seems to have irritated our good senators overmuch. A sneer at knowledge and decency has ever been an occupation of the demagogue and should have no part in a senatorial investigation.

The Housing Corporation was slow and inefficient, there is no question about that. The houses which Congress talked about for over a year it failed to construct, ready for occupancy, in less than four months. But they would have been finished shortly and would have served their purpose admirably.

The congressmen are prophets after the event. It now seems quite natural to them that hostilities ceased on November 11. They forget that up to the last day of the contest they themselves were voting fabulous sums of money to finance its continuance through another twelve months. But Pershing and Foch moved more quickly than was calculated. The foe collapsed. And the Housing Corporation, in addition to its other shortcomings, is accused of benig a poor guesser.

The fundamental characteristic of these houses is that they are the result of a social effort as contrasted with the habitations built for profit, and their superiority over the type to which we have been accustomed is thereby accounted for. Exploration along these lines would reveal unexpected vistas, and these innocent little facts might explain why the heathen do now rage.

In many places in the United States, as the result of all this activity, we now find ourselves in possession of groups of houses of an arrangement and design far superior to anything that speculative effort ever did or ever could do. They have a social as well as a money value, and handled in a sympathetic manner could form a stepping stone to a better era in our housing methods. What shall we do with them? That is the last thing the senators are thinking of, and in ignoring the only practical aspect of the question they are infinitely more culpable than the men they are investigating. There is not one hint of constructive criticism in their entire report. To gain a political advantage they are perfectly willing to dissipate and wreck one of the few blessings which the war has bestowed upon us.

* * *

HIGHER PRICES FOR ROOFIN GMATERIALS

Members of the Associated Roofers of America, in convention last week at Chicago, were practically unanimous in predicting higher prices for roofing material. They claimed, however, that they would not raise the price of roofing on buildings unless forced to do so by the advancing cost of raw materials.

The impractical dreamers are not the architects, but the clients themselves, as a rule.

Tasker Street Wharf, Delaware River, Philadelphia.

NEW BUILDING ORDINANCE FOR LOWER MERION TOWNSHIP.

A recent Pennsylvania State law permits townships of the first class, of which Lower Merion is one, to write their own building laws and to prescribe fire limits wherein none but buildings of a fire-resistive character may be erected.

Acting under this authority the Township Commissioners of Lower Merion accepted the offer of the Main Line Citizens Association to present a building ordinance. It was written by a committee whose members are Messrs M. B. Medary, Jr., Chairman; John Irwin Bright, Paul A. Davis, 3d, Horace W. Sellers, Horace W. Castor and John Ihlder. Messrs D. Knickerbocker Boyd and Victor D. Abel were the consultants and the complete ordinance is now in the hands of the commissioners. The law embodies a number of unusual features.

The Building Inspector, who will be appointed by the Commissioners, will be required to keep on file a complete list of laws and requirements affecting building in its various phases. At the present time there are a number of public utilities companies, fire underwriters associations, etc., whose rulings, if not followed, often cause delay and loss to the builder. The existence of various mandatory State enactments is sometimes unsuspected until at some inconvenient time attention is drawn to them by a State official. All this onformation will be collected and kept in one place at the disposition of the prospective builder.

The keynote of the law is its method of classifying buildings. In the determination of this question the character of its occupancy, or, in plainer terms, its use, is regarded as the index, to be modified later by considerations such as height, size or safety to human life. Materials of construction are divided into seven groups, each graded according to its fire-resistive qualities. Each classification, of which there are six in number, calls for its appropriate grade of materials. The result is an harmonious design from a structural point of view because for any given building the requirements for each kind of material or each subdivision of construction are approximately the same.

The method also greatly diminished the necessity for special rulings, that bete noir of building inspectors, architects and contractors.

The door is left open to inventions and discoveries by the proviso that any material passing certain specified tests may be substituted for any material mentioned. The imposition of present practice upon unknown future conditions is often responsible for serious financial loss to the public and the way to evade the loss is to allow free scope to human ingenuity.

While demanding in general an improvement in structural methods, the part of the law dealing with the large question of materials and their uses is of a flexibility that will bring about the result at the least possible increase of cost.

In legislating for dwellings the suburban character of the territory covered by the law was always kept in mind. It has been frankly stated that the ultimate destiny of the Main Line, at least as far as Bryn Mawr, is an unbroken stretch of brick and concrete buildings, dominated here and there by tall apartment houses and factories. An examination of all modern cities will show how easily this may come to pass, but that it is inevitable is quite a different matter. In the opinion of the committee it is neither inevitable nor desirable and, in writing the law, they frankly endeavored to render difficult and even impossible such a lamentable invasion of this beautiful country-side.

Under the proposed measure apartment houses may be built, but only of a better and safer type than at present.

The crowding together of dark and dismal houses of a flimsy construction will no longer be permitted.

All public schools are now erected subject to the requirements of a State law. They are fairly good, but while they could and should be improved in some particulars, they are uniformly safer and more sanitary than the vast majority of private institutions. Private schools, many of which are now veritable fire traps and disease breeders, will in the future have to be at least equal to the State requirements for public schools.

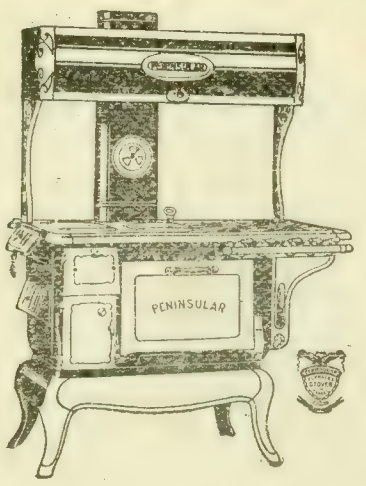
The choice between the present condition of anarchy or a system based on law is now squarely up to the citizens of Lower Merion Township.

The Committee on Building Construction of the National Fire Protective Association, meeting in New York last week, gave this proposed law the sincerest flattery by adopting for their future policy certain of its main provisions.

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

The man who doesn't advertise, these days, is forgotten. The world is too busy to look up dead ones.

You know what propaganda is, don't you? You know, too, how effective a weapon it is, if used properly, don't you? Well, advertising—honest, fair advertising—is the best propaganda we know of. Join the propagandists now! Advertise in the "Builders' Guide."



FIRE LOSSES AND FIRE PREVENTION

A marked decrease in the total fire losses in the United States and Canada is shown by the following table, giving the total losses to property by fire during the months of June, July, August and September, 1919. As is usual, more than half the total loss has occurred in congested and mercantile districts which are largely left during the night without sufficient watchman or fire alarm service. As will be noted, dwellings comprise a surprisingly small percentage, especially in view of the fact that we are frequently confronted with forceful statements by insurance men that wooden dwellings and shingle roofs are the greatest menace to life and property.

Government property	.1	75,000
Total	100. %	$70,918,000

What we most need, according to the Architectural and Building Code Service of the National Lumber Manufacturer's Association, are intelligent men at the head of municipal fire prevention bureaus with broad enough vision to see the necessity for proper building ordinances regulating construction and fire prevention in our congested business districts, where more than half of our annual fire loss occurs.

The insurance men, keen to ride the "combustible roof" and not the "defective flue"—the real cause of 75 per cent. of roof fires, are still harping on the huge loss by conflagration in 1916 but do not state that conflagrations in 1918 and 1919 were practically nil. What is needed is an intensive campaign against the "defective flue" and the careless individual. If laws are made to punish those responsible for *starting* fires, the *spread* of fire will be a negligible item.

A Few of the Reasons

why you should install the **Peninsular Combination Range:**

A Range that burns either Gas, Coal or Wood without any changing or removing of parts—separate or both at the same time—whose oven is always ready for instant use.

A Range that takes up no more space than an ordinary kitchen range, bakes and broils perfectly under all conditions and gives a lifetime of such service.

A Range that makes the kitchen cool in Summer, warm in Winter—beautiful in design, substantial, and easy to keep clean. Secure our prices.

KLEIN STOVE CO.

Front St. & Fairmount Ave.

Bell Phone, Market 3879 **PHILADELPHIA, PA.**

CARTER CONCRETE

The Kind That Lasts

Carter Concrete **PAVEMENTS, FLOORS, CONSTRUCTION—BUILT BY SPECIALISTS SINCE 1888—BUILT TO PREVENT CRACKING, CRUMBLING and DECAY—BUILT TO LAST.**

ORIGINAL COST OF *Carter Concrete* LOW—UPKEEP COST NEGLIGIBLE.

SPECIALISTS IN CONCRETE ROADWAYS

One of our Engineers will help you in Concrete Problems and gladly give you an Estimate.

CARTER PAVING COMPANY

639-41 N. 18th St., Philadelphia, Pa.

Brownstone Bricks

2,000,000 at $16.00 f. o. b. Reading Sidings.

These are high grade pressed bricks, manufactured of crushed stone and hydrated lime. Greater crushing strength and lower absorption than burned clay. Uniform in shape and size. No soft ones. They are beautiful, economical and everlasting.

Red, Gray & Buff Face Bricks

A complete range of colors. Manufactured of vitrifying shale and fire clay. Our prices defy competition.

Straight Hard, Stretcher and Salmon Bricks

All Shale Bricks in carload lots, delivered on job at competitive prices. We are shipping 200,000 bricks daily to 28 building operations.

Vitrified Paving Bricks

Standard specification pavers at lowest market price.

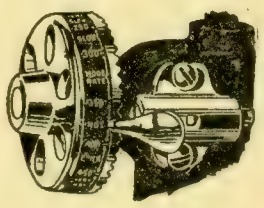
Cement, Lime, Sand, Gravel, Plaster, Concrete Stone and Pebbles

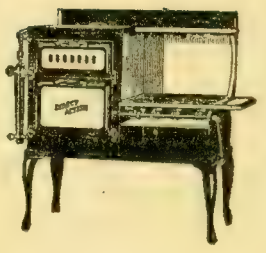
Place your orders with us. We have for years satisfied our customers. **WHY NOT YOU?**

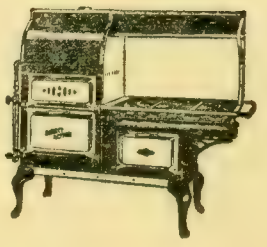


P. H. FAIRLAMB CO. - **115 to 121 S. 30th Street Philadelphia**

One of the many "reasons why" so many homes in and near Philadelphia are being equipped with the

Direct Action Gas Range





is that its patented oven heat regulator eliminates all guess work in cooking and enables one to obtain the same results at all times. It SAVES GAS, TIME, FOOD and WORRY!

We have it connected up with gas on our sample floor and shall be glad to have you and your clients call any time to witness a demonstration. An attractive booklet showing the entire line is yours for the asking.

BORDEN STOVE CO., 1311-1313 Arch St., Phila.

The Touraine Apts, 1520 Spruce street; the Daniel E. Hogan Operations at 54th and Wynnefield avenue, and 60th and Columbia avenue; the William Pilton Operation at 5959 Larchwood avenue; and the Presser Operation at Yeadon, Pa. are a few of the many operations which are enjoying the advantages of the DIRECT ACTION GAS RANGE.

As The Editor Sees It

FIRE losses and fire hazards have received a vast amount of publicity recently and as is always the case publicity has proved prohibitable. The building laws of the country are receiving severe criticism and many suggestions for improving them have been made. Last week we printed in the GUIDE some important changes advocated by the committee revising the Lower Merion Township building laws. Complying with the generous invitation and forceful request made at a luncheon of the Rotary Club by Hon. J. Hampton Moore, Mayor of Philadelphia, to Rotarians and citizens of Philadelphia to co-operate and to suggest improvements, James Pearce, President of the Pearce Fireproof Company, Philadelphia, has made some timely and most worthy suggestions for improving existing building laws and their enforcement. In a letter to Mayor Moore, Mr. Pearce writes:

Having noted your plea for co-operation in your address at the Rotary Club, and after reading the facts in regards to the horrible fire on the 20th instant, I beg to call your attention to a letter which I wrote to Hon. W. I. Schaffer, Chairman of the Constitutional Commission, Harrisburg, on December 22d.

"Fire loss in this State plays a conspicuous role among similar casualties in our country, which last year totaled in round numbers some 250 millions of dollars. For a large percentage of these, existing age-old laws are directly amenable in that they neither place restrictions on the use of building materials, nor assist towards safer construction. This is most emphatically true in the case of home and apartment building. Not only is no requisition made for fireproof construction, but not even for fire resistance, where the matter of price of material presents a small factor for consideration.

Chiefs of Building Departments and Building Inspectors are fully aware of instances where fire protection is most necessary, but cannot enforce precautionary measures on account of antiquated laws which have failed to run parallel with building progress. Legal advice to a Building Department head of a large city was given to the effect that he had authority to enforce Building Laws as written, but that neither the injection of ameliorative legislation, nor the enforcement of utilization of improved fire-resistance came within his domain, regardless of the public benefit it conferred.

Unfortunately individuals like myself, manufacturers of, and dealers in latest and most approved fireproofing and fire-resisting materials, may not offer suggestions for betterment without official criticism or public animadversion, tho business men who promote and manufacture along these specialized lines, are unquestionably the real authorities on improved construction, and the value of material for specific purposes. Experimentation in fire-protective material has entailed large expenditures, and bestowed on its adherents, it seems to me, the good privilege of requesting improved legislation, in keeping with progress, which shall offer further incentive to protection of life and property.

In the revision of present laws for the general betterment of our commonwealth, I trust that special attention will be given Building Codes, that renewed stimulus may be offered those, whom I believe are rendering large and lasting service, and that every reasonable protection may be extended to citizens in both industrial and private life."

Mr. Schaffer has promised that this matter will be brought to the attention of the commission, and I have also received a letter from Mr. Wm. Draper Lewis that this matter has been referred to Mr. George S. Alter, Chairman of Committee No. 1.

Irrespective of any criticism as mentioned in the third paragraph in my letter to Mr. Schaffer, I believe it the patriotic duty of every citizen or tax-payer, who may be acquainted with conditions, to offer suggestions for the benefit of the community. This matter is also being called to the attention of the Master Builders' Exchange, of which I am a member, and I assure that the Exchange would endorse the revision in Building Laws that safeguard lives and property

of our citizens.

The following is an extract from the *Literary Digest,* under date of January 3, 1920, copy of which was forwarded to Mr. Schaffer:

"SHALL WE LABEL FIRE-TRAPS?—The labeling of buildings to show their degree of resistance to fire is recommended in the *Popular Science Monthly* (New York) by F. W. Fitzgerald, who notes that every step of the way toward fire-protection has involved a fight with the property owners, who ought to be most interested, and that force must always be used to get the degree of protection that the public needs. He continues:

"Since it is only by force that we can accomplish anything in that line, let's get still another law or ordinance through: the labeling of buildings. We have laws now as to just how buildings shall be constructed in this or that district, and it is the building commissioner or inspector who passes on the matter, interprets the ordinance, and is the authority in each city. Let us give him still another function: the inspection of all buildings of a public or semi-public nature—churches, halls, stores, hotels, apartment houses, any building that houses more than twenty people under one roof. After these buildings are inspected, they should be put in one of three classes and labeled.

" 'Fire Resisting' would mean that the building is constructed according to all the requirements of fireproof construction; 'Ordinary Construction' would mean that the building, though not fireproof, is reasonably safe and has the requisite sprinkling apparatus or other protection installed; 'Dangerous' would point out the fire-traps. No law, no police, no terrible lessons would have half the effect upon property owners as would this labeling. With 'Dangerous' marked over his door what chance would an owner have of renting his building?"

From information received I understand that if a person builds a one-story store building it is required to have a fireproof ceiling on same; but if the building is constructed so that living quarters are above the store, the fireproof ceiling is not required. The inconsistency, as has been explained to me, is because in the first case the building is classified as a store building, and in the second case it comes under the classification of a residence.

Such organizations as the Master Builders' Exchange would welcome the opportunity to co-operate with you, or your department, should you contemplate any revision in the present Building Laws.

WHERE GOES THE CITY PLANNING MOVEMENT?

By FREDERICK L. ACKERMAN

"FUNDAMENTAL PRINCIPLES"

The literature of the city-planning movement and the conferences devoted to a discussion of its aims and purposes are replete with allusions to what are called, by those who write and talk, the "fundamental principles" which are supposed to animate city planning as an activity and to justify that activity in the light of reason. While it is not difficult to arrive in a general way at a fairly clear understanding of what is meant by the term, and also what it is hoped will be accomplished through an application of the so-called "fundamental principles" set forth, it is difficult to arrive at anything like a clear understanding of what these "fundamental principles" mean in terms of action, or specifically, what it is hoped will result from their application.

To engage in the operation of giving conscious direction to the development of our material environment so that it will better serve the common good is a suggestion in the nature of a "fundamental principle," one which appeals without further description as of sufficient merit to justify approval. But, like all so-called "fundamental principles," it conveys little meaning as to how this is to be accomplished unless broken up and applied to concrete situations, which involves consideration of what sort of action should be taken, for acting obviously must be conceived in terms of existing conditions.

SHALL WE STUDY SYMPTOMS OR CAUSES?

It would appear that any attempt to translate the so-called "fundamental principles" of city planning into such terms as would constitute a program of action which might serve to give direction to the growth and expansion of our material environment along rational lines should be largely, if not entirely, confined to the realm of scientific investigation and not that of mere speculation, for, as suggested, results are obtained through definite action applied to real situations. Scientific investigation should, therefore, address itself first to an inquiry into the causes which have brought about the condition, which, in turn, give rise to that activity which finds its justification on the ground that by action along certain lines changes in our ill-arranged material environment may be affected which will make for the common good. For it should be obvious to anyone that any attempt to modify existing conditions in our material environment will not become effective unless the causes which gave rise to existing mal-adjustments are eliminated. Hence it would appear that we have a point of departure which may serve as a basis of an inquiry into the present status of the city-planning movement and an evaluation of the work of those engaged in it. This same inquiry may well be used as the basis for a program of action to be applied to real situations.

Any brief statement, of course, which attempts to set forth what might be characterized as the "fundamental principles" which are to be observed by those engaged professionally or otherwise in the complex activities of working out these changes must be in the nature of broad generalizations qualified by numerous exceptions. For in the volume of literature spoken of in the first line of this article, there is to be observed a considerable range of opinion as to what city planning is, particularly with respect to the professional qualification of those who engage in it. At best, little more than a rather loose and inaccurate description must be used. But for the purpose in hand this loose description will be sufficiently accurate, since it is not at all difficult to discover, in so far as definite action is proposed, that the consensus of opinion is in favor of confining action to a certain fairly well-defined attitude as regards matters with which it is deemed pertinent for those engaged in city-planning work to deal.

"NORMAL TENDENCIES"

Without attempting to state in precise terms what may be said to express the underlying purposes of city planning as conceived by its spokesmen; without attempting to set forth the activities which its professional advocates assume should fall within the field of their own special concern; without venturing an opinion as to what constitutes the relative importance of the various professional or lay points of view which must be recognized, given a hearing, and made use of, it is clear beyond any question that the opinion which most readily passes current among the spokesmen of the movement is that city planning is an activity which takes its point of departure in the conditions of the present, and which proposes to accomplish its purpose largely

Advance Construction News

CONTEMPLATED CONSTRUCTION; ARCHITECTS AND OWNERS; COST LIMIT; LAST DAYS FOR FILING BIDS; FIRMS FIGURING; CHARACTER OF MATERIAL AND EQUIPMENT REQUIRED; ADVANCE INFORMATION IN EVERY PHASE OF NEW CONSTRUCTION

Store and Apartments (alts. and add.), S. E. corner Sixteenth and Venango streets. Architects, Neubauer & Supowitz, 929 Chestnut street, Philadelphia. Owner, Herbert A. Buxbaum, 3516 North Seventeenth street, Philadelphia. Brick, 1 story addition, 15x18 feet, new slag and tin roof, pine floors, steam heat, electric light, tile work, plumbing. Architects and owner taking bids, due February 13th. Lam Building Co., 1001 Wood sreet; A. H. Spenard, 822 Wood street, and Louis Cohen, 417 Christian street, are figuring.

Store Building (alts.), 1007 Arch street, Philadelphia. Architects, Day & Zimmerman, 611 Chestnut street, Philadelphia. Owners, Rumsey Electric Co., on premises. Brick work, mill work, carpentry, plastering, composition floors, skylights, ceramic tile, new elevator shaft, kalamein doors (roofing, fire escape, elevator, heating and electric work reserved). Engineers taking bids, due February 14th. John A. Codori, 1235 Arch street; Smith-Hardican Co., 1606 Cherry street; Barclay White Co., 1713 Sansom street; H. John Homan, Middle City Building; Stokes Bros., 6723 Musgrave street; Sutton & Stephenson, 1317 Washington avenue, and F. A. Havens & Co., 845 North Nineteenth street, are figuring.

Service Station and Garage, 3723 Walnut street, Philadelphia. Architect, private plans. Owners, C. C. Coolbaugh & Frank C. Mackland, Nineteenth and Cambria streets, Philadelphia. Terra cotta and brick, 1½ stories, 40x120 feet, slag roof, cement floors, stone foundations, electric lighting, steam heat, rolled steel sash, rolled steel skylights, fire doors, roof ventilators. Owners taking bids, due as soon as possible. J. D. Fisher, 5414 Thompson street, is figuring.

Residences (18), Duncannon and Hutchinson streets, Philadelphia. Architect, E. Allen Wilson, 1208 Chestnut street, Philadelphia. Owner, Hugh L. Hiller, care of architect. Brick and stone, 2 stories, 16x45 feet, slag roof, oak floors, stone foundations, hot water heat, electric light, tile and marble work. Architect taking sub-bids.

Office and (4) Apartments (alts.), Broad and McKean streets, Philadelphia. Architect, E. Allen Wilson, 1208 Chestnut street, Philadelphia. Owner, Franklin C. Scheid, Fifteenth and Snyder avenue, Philadelphia. Brick, 3 stories, hardwood floors, metal lath, cement work, plastering, flush bulks, hot water heat and plumbing. Owner is ready for sub-bids.

Dwelling, N. E. corner of Washington Lane and Greene street, $10,000. Architect, private plans. Owners, hiladelphia Housing Corp., 4938 Greene street, Philadelphia. Brick, 3 stories, 20x20 feet, 30x15 feet, steam heating, electric lighting. Owners will build.

Dye House (add.), Palethorp and Allegheny avenue, $7,000. Architects, Wm. Steele & Sons Co., 1600 Arch street, Philadelphia. Owners, Cadet Hosiery Co., Second and Allegheny avenue. Brick, 1 story, 33x47½ feet, slag roof, cement floors. Engineers will build.

Shop, 2239 North Thirtieth street, Philadelphia, $2,500. Architect, private plans. Owner, Chas. J. Williams, 3200 Arizona street, Philadelphia. Brick, 1 story, 16x60 feet, slag roof, electric lighting. Owner will build.

Dispensary (add.), Old York Road, Philadelphia. Architects, Magaziner & Eberhard, 603 Chestnut street, Philadelphia. Owners, Jewish Hospital, Old York Road, Philadelphia. Stone. Preliminary plans in progress. Too early for details.

Garage, Ludlow street, between Fifty-second and Fifty-third streets. Architect, private plans. Owner, J. D. Fisher, 5414 Thompson street, Philadelphia. Brick, slow burning construction, 1 story, 100x128 feet, slag roof, cement floors, stone foundations, steam heat, electric lighting, millwork, rolled steel sash, rolling doors, roof ventilators. Owner is taking sub-bids.

Factory (alts.), Twenty-third and Locust streets, Philadelphia. Architects, Stuckert & Co., Crozer Building, Philadelphia. Owners, Crane Ice Cream Co., Twenty-third and Locust streets, Philadelphia. Office partitions, tile work, cement work, plumbing, painting, heating and electric work. Architects subletting and will build.

Bridge, Forty-ninth street, over P., B. & W. R. R., Fortieth Ward, Philadelphia. Engineer, private plans. Owners, City of Philadelphia, Bureau of Surveys, Department of Public Works, care of Director John C. Winston, 416 City Hall. Brick, with grading, paving and appurtenant work. Owners taking bids, due February 20th at noon.

Sewer, Bigler street, from Delaware River to Severn street, Philadelphia. Owners, City of Philadelphia, Bureau of Surveys, Department of Public Works, care of Director John C. Winston, 416 City Hall. Sewer, inlets, manholes, well holes, laterals, branch sewer spurs. Owners taking bids, due February 20th at noon.

Factory Building, Nos. 8 and 10 Queen street, Philadelphia. Architects, Heacock & Hokanson, Bailey Building, Philadelphia. Owners, J. Milton Hagy Waste Works, 836 South Swanson street, Philadelphia. Concrete, steel and brick, 4 stories, 40x92 feet, slag roof, concrete floors, stone foundations, kalamein doors, fire escapes, iron work (heating, electric work and elevator reserved). Architects taking bids, due February 16th. J. Sims Wilson Co., 1125 Brown street; Wm. R. Dougherty, 1610 Sansom street; A. R. Raff Cont. Co., 1635 Thompson street; Barclay White & Co., 1713 Sansom street, are figuring.

Property (alts. and add.), 30, 32 and 34 South Second street, Philadelphia. Architect, Frank E. Hahn, Denckla Building, Philadelphia. Owners, Philip J. Walsh estate, on premises. Brick, 3 stories, 11x46 feet, slag roof, pine and parquetry floors, stone foundations, electric light, hollow metal skylights, metal ceilings, dampproofing, iron work, metal lath. Architect has received bids.

Residence (alts. and add.), Huntingdon street and Germantown avenue. Architect, Wm. H. Wooters, 816 West Allegheny avenue, Philadelphia. Owner, Otto Schlieske, on premises. Brick, steel and stucco, 3 stories, 37x20 feet, slag roof, pine floors, stone foundations, electric light, marble work, hollow metal skylights, metal ceilings. Owner taking bids, due February 17th. Thos. C. Trafford, 1615 Sansom street; Frank K. Stahl, 2713 North Park avenue, and Ketcham & McQuade, 1029 Brown street, are figuring.

Store Building (alts. and add.), N. E. corner Tenth and Market streets, Philadelphia. Architects, Hoffman Henon Co., Inc., Finance Building, Philadelphia. Owners, Schulte Cigar Co., 386 Fifth avenue, New York City. General alterations and additions. Plans in progress.

Power House and Engine Room, Baynton street and Chelten avenue. Architect, Frank V. Nickels, 4400 Main street, Manayunk, Philadelphia. Owner, C. E. Dearnley, Manayunk, Philadelphia. Reinforced concrete, 1 story, 33x90 feet, slag roof, cement floors, electric lighting. Brick stack, 100 feet high, 10 feet base, 5 feet top. Architect will be ready for bids in a week.

Residences (11), Fifteenth above Olney aveenue, Philadelphia. Architect, private plans. Owner, Wm. P. Baltz, 5435 North Eleventh street, Philadelphia. Brick, 2 stories, 16x50 feet, slag roof, oak floors, stone foundations, electric lighting, hot water heat, tile work. Owner will build.

Store Building (alts.), 4446-48 Frankford avenue, Philadelphia. Architects, Magaziner & Eberhard, 603 Chestnut street, Philadelphia. Owner, Henry Stein, 4450 Frankford avenue, Philadelphia. Roof repairs, brick work, iron work, carpentry and mill work, plastering, metal lath, plumbing, elevator. Architects have received bids.

Residences (4), Olney, Philadelphia. Architect, Wm. H. Gilmore, Godfrey and G streets, Philadelphia. Owner, Wm. C. McClay, 4801 "A" street, Philadelphia. Brick, 2 stories, 16x50 feet, slag roof, oak floors, hot water heat, electric lighting, stone foundations, tile work. Owner will be ready for sub-bids in a week.

Motion Picture Theatre, Fairmount avenue and Lex street, Philadelphia. Architects, Mitchell & Neely, 1619 Chestnut street, Philadelphia. Owner, Wm. Hill, care of architects. We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

SHEETROCK WALL BOARD *Is Easily Applied*

While Sheetrock is easily applied as other wall boards, the firm gypsum rock sheets being eaaily sawed and nailed, Sheetrock can be applied more quickly than other wall boards because Sheetrock boards are uniform, fewer nails are required and the joint treatment is simple.

For the walls, ceilings and partitions of new buildings, or for alteration and repair work, Sheetrock is unequalled. Architects, contractors and carpenters recommend it.

Sheetrock Wall Board will not warp, crack or buckle and requires less paint or calcimine than other interior finishes Saves time, money, labor and materials. Brighten the home and adds distinction,

Size and Leadership

Size is a matter of dimensions. Given enough capital, anyone could duplicate the Kuehnle organization. But Kuehnle leadership is due to the skillful use of finest paints. Our size is due to recognition of and demand for Kuehnle quality in painting.

Plans or No Plans

There are two classes of builders who need the help of a strong, modern lumber centre,—those who have *planned* their operations well, and those who haven't.

If you have planned well, you will need a strong organization to help carry out your plans. The best is none too good. In big building operations, all of our experience and resources, including the powerful aid of our Traffic Department, are constantly required.

But if you have *not* been able to make careful plans; if you are forced to build hastily and under pressure, then only an uncommonly strong organization will enable you to accomplish your purpose. When you need unusual stocks or service that you have no right to expect, then the resources of the LLOYD organization will often save the day for you.

Some day you'll build. If you want the work finished on time, see that the lumber comes from *LLOYD.*

LLOYD

Established 1868

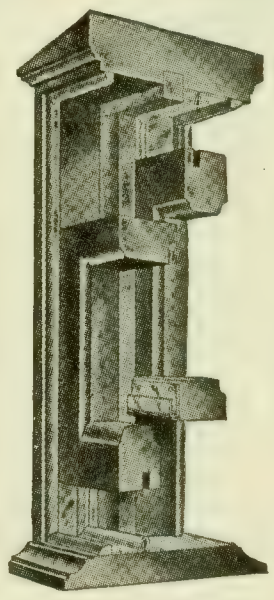
Proposals

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., January 31, 1920.—Sealed proposals will be opened in this office at 3 P. M., March 29, 1920, for the construction of the United States Post Office and Custom House at Apalachicola, Florida. Drawings and specifications may be obtained after February 16, 1920, from the custodian of the site at Apalachicola, Florida, or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., February 2, 1920.—Sealed proposals will be opened in this office at 3 P. M., March 3, 1920, for alterations, etc., to the United States post office and customhouse at Oswego, N. Y. Drawings and specifications may be obtained from the custodian at the building or at this office, at the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from Page 108.)

through restrictive legislative action by following a course strictly limited to considerations of "expediency." This regard for "expediency," which is clearly to be observed in every phase of the activity, is set up by the spokesmen of the city-planning movement as constituting a meritorious attribute which should appeal to the conservative and to those who are inclined to the perpetuation of the *status quo ante.*



For in the past it has been the conservatives and those particularly interested in holding the ground already secured who have largely controlled the affairs of government and the economic situation in general and, naturally, any program of action which fails to be accorded a high rating among such as hold to the conservative point of view would not stand any very good chance of immediately becoming effective, and hence the advocacy of what is rated as "expedient" is set up as a "fundamental principle." To be more specific one of the "fundamental principles" set forth for guidance in connection with the preparation of zoning ordinances, and the like, is that any scheme which is to be advocated should give due regard—in fact, it should above all recognize those "normal tendencies" of city growth.

This, perhaps, is as good an illustration as need be given in support of the contention that the entire movement, as now staged, is so based upon considerations of "expediency" as to amount to inhibition or stultification.

POLITICAL EXPEDIENCY VS. REAL PROGRESS

Zoning, like all other measures of a restricted character, is supposed to be directed toward the curbing of definite, well-established or "normal tendencies" which have resulted from the freedom of action that is guaranteed in certain fundamental political documents and supported by judicial decisions. By restrictive action, such as is exercised in the zoning of cities, for example, an exterior authority, so far as the individual is concerned, is created to step in and limit action. Since that group of problems with which we are confrontetd in our malad-

justed urban centers arises out of the so-called freedom of action of individuals, it would appear reasonable to assume that what we need to check is no less than those "normal tendencies" which arise out of the comparative freedom of action of individuals. But this does not appear to be the conclusion of the spokesmen of the movement, for while it is generally stated that the problem is to be solved by restrictive legislative action, it is at the same time stated as a "fundamental principle" that by restrictive action we should not thwart "normal tendencies." Of course, this may be using an illustration in which other considerations may very properly be taken into account by way of qualifications; but for the question at hand, it should be sufficiently accurate.

It is this attitude of projecting a future upon the basis of the *status quo ante* which effectively thwarts progress and prevents the acquisition of any accurate knowledge concerning what are the causes which work for present maladjusted conditions. It is a pure assumption that out of present tendencies better conditions in the future may be created; what evidence there is at hand points clearly in the opposite direction.

The inclusion of considerations of "expediency" among the "fundamental principles" which should direct the work of those professionally engaged in the work of city planning, or which are to be used in the work of stimulating public opinion, lifts the entire activity right out of the field of scientific research and investigation, and lodges it in the field of politics. This statement is not made with a view of depreciating the value of considering a program of action in terms of practical politics; it is rather presented with a view of pointing out that any scientific study of causes cannot properly be rated as such so long as it takes possible political consequences into account in the formulation of its conclusions. This is precisely the error into which the spokesmen of the movement have fallen in their attempt to organize the so-called "fundamental principles" of city planning. The so-called "fundamental principles" are merely suggestions of what is deemed to be politically expedient at the present juncture. At the present juncture what is deemed politically expedient is action, which coincides with "normal tendencies;" and "normal tendencies" are obviously the cause of our trouble. Translated into workaday English, "normal tendencies" represent the right of the individual to use the community as a machine for procuring individual profits and benefits, without regard to what happens to the community. That is why we have maladjusted communities. That is why we shall continue to have them, so long as the spokesmen of city planning continue to proclaim that adjustment can be had without touching the sacred causes of the maladjustment.

UNWARRANTED ASSUMPTIONS

"Normal tendencies" is merely descriptive of developing situations which now prevail and are clearly evident upon superficial examinataion. Action in any field takes a direction determined always by the resultant of the forces acting upon that field. That the more powerful of the forces which gives rise to a situation are beneficent does not follow; and hence any assumption that "normal tendencies" or tendencies which may be said to be characteristic of a developing community will result, if followed, in a better condition is not warranted.

Hence, it is that a study of the forces out of which the present maladjustments have arisen, should be the focus toward which inquiry should be directed, and an inquiry of this nature would concern itself with causes and not with prospective political situations. An inquiry of this nature would reveal the prospect, likewise, of what would likely be the outcome of any attempt to deal with these causes by other methods than that of allowing them to operate in comparative freedom —which is what is meant by saying that in our schemes of restrictive legislation we should above all recognize and allow "normal tendencies."—*Journal of the American Institute of Architects.*

WHAT IS A FAIR HOUSE RENT?

Builders are More Interested in House Rents Than Anyone Else, Because the Earnings of Buildings Lies at the Root of Building Enterprises— This Story Analyzes the Reasonableness of Higher Rents, according to Leslie H. Allen, of the Aberthaw Construction Co.

Landlords all over the country are in trouble with their tenants, because they find it necessary to raise rents. Ordinarily it is a mere question of supply and demand, and many a landlord has boosted his figures about as much as he thought the "traffic would bear." But when we examine the real facts in the

Washed Bar Sand and Gravel will take less cement on concrete work. We know how.

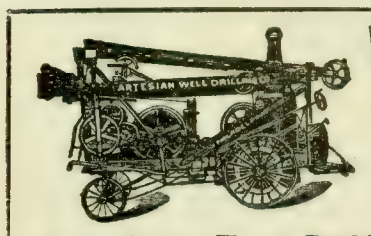
sitation, what do we find? While there have been many cases of apparent extortion, the fact remains that rents have increased, on the average, not over 20 per cent., in a period which has seen foods, clothing, and other items of expense go up from 75 to 150 per cent. Because other things have increased in price is no reason for advancing rents. But how is the building owner situated with respect to operating costs on his property?



As a typical case, let us consider a two-family house built in 1900, which has five rooms downstairs and seven rooms upstairs. It cost the owner $6,500, of which $1,000 was land and $5,500 was house complete. He invested $3,000 cash and placed the other $3,500 on a mortgage. His assessment on the property was $5,000. What rent should he obtain from the two "halves" of the house? The fact that he actually rented these two portions at $25 and $30 respectively, or a total of $55, has no direct bearing on the answer to the above question, says Leslie H. Allen, of the Aberthaw Construction Co. of Boston, for it furnishes no evidence that the owner properly analyzed his costs or made adequate allowance for the future.

Let us examine the owner's costs and what ought to be his earnings, both in the light of prices and conditions as they existed in the first fifteen years of this century, what they are today and what promises to be tomorrow's scale.

His mortgage at 6 per cent. (the prevailing rate in 1900 to 1915) would cost him $210 per year. His taxes at $20 per thousand per year would cost him $100. If we allow $25 for insurance and water, this makes standing fixed charges of $335 per year, which have been practically maintained year after year, with only slight upward changes during the past few months. His minor repairs, which may be estimated at about $20 a year under the old conditions, are now at least $35 for identically the same amount of work. While the growing decay of the house would normally make repairs much more necessary today than ten or fifteen years ago, this figure of $35 will be used in the comparison. There is no janitor, and each tenant provides his own heat.

Any building owner who rents his property must pay from that rental his mortgage interest, insurance and water rates and the minor repairs necessary from time to time. Ordinarily those are the only items considered in arriving at a proper rental figure; but the owner, who is something of a financier—using the word in the most commendatory sense—looks farther ahead than this. He knows that the outside of his house requires painting every three years; that the inside requires painting and papering every ten years. He knows that in twenty years, more or less, he will have to put in new furnaces, put on a new roof and thoroughly overhaul his entire system of plumbing. It is these items of infrequent occurrence, but of large aggregate amount, which the ordinary small house owner or landlord fails to appraise or appreciate until they strike him a knock-out blow by their sudden necessity.

The cost of painting the outside of the house, which would have been about $150 in the earlier years, would be around $320 today. The cost of papering and painting the inside has likewise advanced from about $300 to $500. The installation of two new furnaces, one for each tenant, would have cost about $200 ten or twelve years ago; today they cannot be put in for less than $300. If new roofing had been required before prices went up it would have cost about $220; today the figure would be nearer $360. New plumbing, in so far as renovation would be necessary at the end of twenty years, would today cost no less than $500, in place of the $400 before the

war.

These items, occurring at infrequent intervals, would not show in the owner's balance sheet normally until they had to be met. The farsighted owner, however, would make provision in advance, count up his cost, measure his cost and provide in his rent each year's pro rata share for each of these several items, which he knows are coming on as relentlessly as death and taxes. Under the earlier schedule of prices, as well as under the new, his yearly carrying charge for these items will be about as follows:

	1910	1920
Painting outside of house ...	$50	$107
Painting and papering inside.	30	50
New heating plant.....	10	15
New roofing	11	18
Renovating plumbing	20	30
Minor repairs, annual	20	35
	$141	$255

During the period of low prices, now well behind us, the owner would have required $476 per year to cover his interest, taxes, insurance, water and the pro rata share of the renovations covered in the above table. In addition to this, he should have had enough income from the house to pay him a satisfactory percentage upon his investment of $3,000 cash. What should this percentage of return be?

He could have invested his money in the early years of this century in any one of a number of thoroughly good stocks which would have paid upwards of 6 per cent., and would have incurred no business risk—no risk of vacancies, no risk of dissolving in smoke and no risk of sudden damage from any one of a dozen sources which might affect the house. If it be assumed that insurance would take care of his fire risk, let us remember that while it might reimburse him for the actual cost of his building. it would not pay him his rental during the six-months period of rebuilding, all of which would be a total loss. To cover all of these items, it would only be fair for the owner to obtain perhaps 10 per cents upon the actual cash investment of $3,000. Adding to this $300 to his average annual outlay, we find that the rent of the two parts of the building under the old condition of prices should have brought some $776, or approximately $65 per month. This might be split into $30 and $35 respectively for the two parts of the house, or $5 more for each part than was actually charged in the case under consideration.

As the owner has not received what we shall have to recognize as an adequate rental during the earlier years of the life of his building, he has not been able to accumulate a fund for depreciation as the building gradually wears out. This being the case, his rebuilding or renovating program must necessarily come from capital rather than from previous earnings, and this definitely adds to his actual investment in the property—an addition which should share equitably in the annual earnings. Unless such a property has earned enough to provide in advance for contingencies, it is not on a healthy or thoroughly stable basis, and cannot be expected to act as a stimulant to the investment of money in such enterprises.

With the present high prices for every element entering into repairs and upkeep, the condition has changed considerably. In place of $141 for renewals, we find that such renewals as will have to be made from now on should be provided for at the rate of $255 per year. This makes his total fixed charges, so to speak, $590 per year. Adding his normal 10 per cent. return on his investment, we have a total of $890 per year or $74 per month. This might be apportioned at $34 and $40, for the two parts of the building, and even then does not cover the failure of past rentals to provide for the present high prices of roofing, plumbing and heating renewals. But the owner has carried the building more than fifteen years at a rate altogether too low to permit him to make the necessary renewals under present prices, and still come out whole on his investment. If, therefore, he were to raise the rent to say $80, or $36 and $44 for the two parts of the house, which is not quite 50 per cent. above the old rental figures, he would be obtaining for his property no more than it should bring him.

It will be noted that his $55 per month, or $660 per year, leaves him only $70 per year as return on his investment, when present prices are considered. This is only 2 1-3 per cent. Will any one argue that that is a fair return on money invested in an enterprise of ordinary business hazard?

There appears no indication that costs of operating and maintaining buildings will dimnsh. The cost of labor is continually rising, and it may well be that next year will see the upkeep figures decidedly higher than they are today, with a correspondingly greater deficit to be made up, due to insufficient rents in past years.

It may perhaps be unreasonable to expect tenants to look at the matter from this point of view. They have been accustomed to apportioning their outgo on the basis of a certain amount for rent and certain other amounts for other purposes. An increase of 40 or 50 per cent. in one of the major items of expenditure will inevitably call forth strenuous protests. (We have been accustomed to consider rent as absorbing from one-fifth to one-fourth of wages and of small salaries.) Pure fairness, however, Mr. Allen maintains, requires that both sides of the question be examined and that a rental be fixed which will be fair alike to the owner and to the tenant. The average tenant would reject with scorn any suggestion that he pay a portion of the proper rent and receive the balance as a charity gift. Yet that is exactly the situation, when he pays less than the properly ought in all fairness to bring, however strong his disinclination to pay more than he has been paying in the past.

Because rents are now too low on buildings, and because of the tenants' opposition to permitting them to reach a logical figure, building for renting purposes holds no attraction for investors. The cost of construction is so much higher today than it was at the time our example was erected than a fair rental on a new building would be much higher than on the old. This is precisely a fact which tenants do not desire to recognize; but just as long as money has to be spent in the upkeep of a building and to pay for taxes and insurance on the building, and interest on money borrowed for its erection, just so long will it be necessary to fix a rental high enough to cover all of these items, and leave a fair profit for the man who provides the housing accommodation.

—National Builder.

Making Public Work Attractive.

By O. P. CHERDRON.

In the Members' News-Letter of October 18, I note that President Garber has been appointed Chairman of the Finance Committee for the organization backing the movement for the establishment of a National Department of Public Works. In my opinion, the successful outcome of this campaign would mean a great step toward the uplifhting of the contracting profession.

While such a movement is very commendable, it occurs to me that the present method of letting public work is wrong, and if the Swiss method of letting public work were adopted, I believe many more responsible and reliable contractors would be willing to undertake public work. As not all may be familiar with this plan, I will describe it briefly.

In Switzerland, contractors of standing and proved reliability are invited to compete for public work, and before a contractor is invited, he has to have an established reputation for fairness in his

Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

dealings and competency in his profession. No bidders will be admitted except upon invitation by the public board.

After such a public board has received the bids, it will not let the work to the lowest bidder nor to the highest bidder, but it will let it to the bidder who is closest to the average bid received. For instance, on a project involving the expenditure of $200,000 there are received by the public board in Switzerland five bids. The bids range as follows:

A	$196,000.00
B	218,000.00
C	212,500.00
D	197,368.00
E	217,950.00
Total sum of all bids ..	$1,041,818.00
Average bid	$ 208,363.60

In this case bidder "C" would get the business. If a contractor should try to throw the average bid up or down by juggling, his bid would be rejected and, if he cannot prove that he made an honest mistake, he would forfeit his right to bid on future public work for a certain period of time. For instance, should bidder "A" bid $120,000,000 instead of $196,000.00 and should bidder "B" bid $310,000.00 instead of $218,000.00 those two bids would be rejected by the board, and those two bidders would not be allowed to bid for a certain length of time on any work. Their bids would not be considered in the general average on this particular set of bids.

If the Swiss method of letting work were generally adopted, it would in my opinion help very much toward the elevation of the contracting profession.—*Bulletin of Associated General Contractors.*

STANDARDIZE CONTRACT FORMS

Associations Should Present Good Practices Instead of Condoning Present Methods.

By A. P. Greensfelder.

Secretary, Fruin-Colnon Contracting Company.

An abundance of opportunities is offered for productive work by the Associated General Contractors of America—we'll agree to that. The only question that may arise concerns which problems should receive attention first; I suppose the answer is to go after each with a definite program, concentratnig on those that circumstances bring to the front. Certainly one of the foremost problems is that of improving contracts.

The attitude taken by some of the engineering associations and societies toward establishing standard forms of contracts has been disappointing. Their position apparently has been that the contractor should beware of what he signs; then if he finds himself in trouble, he should hire a lawyer to extricate him, or stand his losses without a word. All very good, but if he wants to be a contractor, he must sign a contract now and then, whether it be fair or unjust.

We cannot concur that it is wise to have lawyers contine to defend bad practices. We believe that it is up to progressive associations to present good practices. Contracts that are equitable and fair to both parties tend to reduce legal controversies. We do not take issue so much with specifications drawn by the older and more experienced engineers and architects, but rather with those presented by the younger and inexperienced men employed by smaller communities. Contact with contractors usually proves that they are human and of a rather decent sort, and can be treated fairly without danger of their walking off with the buildings they have agreed to erect.

It surely would seem to be the province of an association as enterprising and progressive as the American Water Works Association, for example, to protect the interests of water works owners by drafting an equitable form of contract—one that reputable contractors would have no hesitancy about accepting. I mention the American Water Works in particular because that organization has a Committee on Standard Form of Contract. Enforcing the use of such a contract would be necessary, as custom will gradually bring it into current use, as has been demonstrated by the forms adopted by the A. I. A.

With the Associated General Contractors of America now in the field with a vigilant eye upon the contractor's interests, one may hope that a series of standard forms of contracts will be developed in which the contractor and the engineer receive equal consideration.—*Bulletin of Associated General Contractors.*

DIVIDING LINE BETWEEN ARCHITECT AN ENGINEER

What is the dividing line between the work of engineers and of architects, and is an architect justified in accepting work which is usually regarded as being strictly within the sphere of the engineer, or vice versa?

Naturally members of both professions do not look with favor on what may be called encroachments on their particular fields; and doubtless both could put up strenuous arguments to prove that work which may be on the border line comes within their own special province.

For example, there are engineers, sometimes termed construction engineers, who make a specialty of designing and supervising factories and warehouses—buildings which do not call for architectural beauty, but for great structural strength and design to meet the needs of given industries. Architects might contend that members of their profession are capable of designing such plants, while engineers will be equally emphatic that such buildings involve little or no architectural knowledge and are purely within the domain of the engineer.

The general question of engineers' and architects' work was recently discussed by the Montreal branch of the Engineering Institute of Canada, the discussion being based on a report that the county authorities at Pittsburgh had given commissions to two firms of architects to design and supervise the construction of two large bridges, one with a 500-foot span. Written comments by members on the subject were read. These, with one exception, were emphatic in their condemnation of this action, and some members even advocated a policy of boycotting should the practice become more general.

Fortunately the discussion at the meeting was on more conciliatory lines, and according to *Contract Record,* a trade journal published in Toronto, the general feeling was that the subject was one for co-operation, not for measures which would create antagonisms between the professions. It was frankly admitted by members of the Quebec Architects' Association, that such large bridges as were referred to were within the province of engineers, but it was pointed out that many bridges designed by engineers were lacking in beauty, which defect could have been obviated by consulting architects. Each profession had its own field and when an engineer, in designing a bridge, desired to make it architecturally beautiful, he should call in an architect as consultant.

The opinion was expressed that while the design of bridges was a matter for engineers, the latter had often sadly lacked a sense of aesthetic beauty in making their designs. Some of the bridges were downright ugly.

Times have changed, and now people look for beauty as well as utility, and as a means to these ends what could be better than the combined talents of the architect and the engineer?—*Architect and Engineer.*

Brownstone Bricks

2,000,000 at $16.00 f. o. b. Reading Sidings.

These are high grade pressed bricks, manufactured of crushed stone and hydrated lime. Greater crushing strength and lower absorption than burned clay. Uniform in shape and size. No soft ones. They are beautiful, economical and everlasting.

Red, Gray & Buff Face Bricks

A complete range of colors. Manufactured of vitrifying shale and fire clay. Our prices defy competition.

Straight Hard, Stretcher and Salmon Bricks

All Shale Bricks in carload lots, delivered on job at competitive prices. We are shipping 200,000 bricks daily to 28 building operations.

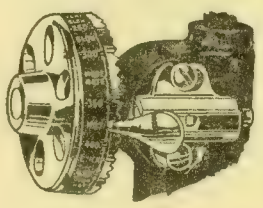
BUILDERS' SUPPLIES

To be assured of prompt deliveries of the best grades of

Cement, Lime, Sand, Gravel, Plaster, Concrete Stone and Pebbles

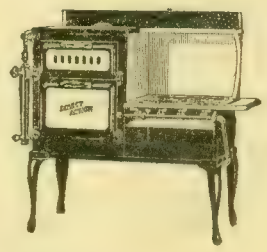
Place your orders with us. We have for years satisfied our customers. **WHY NOT YOU?**



P. H. FAIRLAMB CO. - **115 to 121 S. 30th Street Philadelphia**

One of the many "reasons why" so many homes in and near Philadelphia are being equipped with the

Direct Action Gas Range



is that its patented oven heat regulator eliminates all guess work in cooking and enables one to obtain the same results at all times. It SAVES GAS, TIME, FOOD and WORRY!

We have it connected up with gas on our sample floor and shall be glad to have you and your clients call any time to witness a demonstration. An attractive booklet showing the entire line is yours for the asking.

As The Editor Sees It

IN line with the suggestions made in the GUIDE in the issue of January 1st, the Builders Exchange has taken steps toward promoting co-operation of the many firms, corporations and individuals connected with the building industries of Philadelphia. This is the psychological time to inaugurate such a movement, as this year will undoubtedly present many opportunities for the development of closer affiliation as the extensive construction work in prospect bids fair to make this year the greatest in the records of the city.

An effort to secure new members of the Exchange will be made and it is hoped that all firms or individuals in any way allied with the building trades will be alive to the importance of making the Exchange a really valuable organization for the solving of problems daily confronting the industry. Weekly luncheons will again be inaugurated and the Entertainment Committee has plans for many get together occasions.

Due to the recent resignation of the secretary of the Exchange, James A. Barrett, a new secretary Camillurs Phillips, was elected and an assistant secretary, Charles H. Trommer.

Mr. Barrett's services were helpful to the members, but as his work was always limited, due to the authority vested in him, Mr. Barrett could not do many things that his iniative prompted. The two new secretaries will have plenty of opportunity to do many services for the members of the Exchange individually and for the organization as a body. If, however, their hands are tied too tightly they may be delayed in developing the Exchange to the highest degree of usefulness.

In announcing these elections, together with the committees of the Exchange named for the current year, Major Edwin E. Hollenback, the president, said:

"Philadelphia and its people confront this year a condition that is without precedent in every phase of the problem of shelter. The physical health, the moral welfare and the industrial efficiency of our entire population are vitally involved in the problem of providing adequate housing and other larger units of construction. This is a year when the need of materials vastly outruns supply. It is the year when urgent necessity compels us to make up, in really large measure, for the five years of inactivity in building forced on us by the war. It has been conservatively estimated that we will build to the amount of $150,000,000 during 1920. We will. But we will only by means of a co-operation among all branches of the building industry, such as has never been previously attained.

"The Master Builders' Exchange, as the only local institution of sufficiently broad scope, must assume the responsibility for effecting the close understanding and the vigorous team action required. It was exceptionally fortunate in having as president during the years 1918 and 1919, Mr. O. W. Ketcham, who, foreseeing the conditions now besetting us, so guided policy of the Exchange that we attack our problems with the ground cleared of its most formidable obstacles. He consented to act as chairman of the Membership Committee, this year one of major importance, in enlisting the services of those hundreds of new members whose help is called for not only by the Exchange, but by the public for the fulfillment of the building program that is outlined."

The committees appointed to serve for 1920 are as follows:

Executive—W. Nelson Mayhew, chairman; John R. Wiggins, Benjamin F. John, Calvin I. Leiper, Edwin E. Hollenback, O. W. Ketcham and George J. Watson.

Finance—Benjamin F. John, chairman; Edward Lupton, Edward A. J. Evans, Joseph M. Steele, O. W. Ketcham and George J. Watson.

Legislative—John R. Wiggins, chairman; Barclay White, Henry E. Baton, John S. McQuade, F. M. Harris, Jr., Joseph M. Steele and J. H. Cowperthwaite.

Arbitration—C. I. Leiper, Barclay White, W. Johns Stevens, Constantine Belfi, J. P. Thompson, Howard McGinley, Frank G. Pate, Harry Quay, Joseph

Test SHEETROCK WALL BOARD *Before You Buy*

Take samples of Sheetrock and other wall boards and test them.

Hold a match under Sheetrock for any length of time and it won't burn.

Ordinary wall boards make most buildings fire-traps. Ordinary wall boards ignite in from seven to eight seconds. This is why Sheetrock was preferred by the U. S. Government for its army cantonments.

Compare Sheetrock in thickness with ordinary wall boards—it is nearly twice as thick. Try to break it. Scratch the pure gypsum rock center. Drive a nail thru it. Every test will prove the superiority of Sheetrock.

Made of the same material as the scratch coat of plaster, pure gypsum rock, Sheetrock is sandwiched between mineralized sheets or paper that take the place of the finishing coat of ordinary plaster.

Sheetrock is suitable for any room in any building. It presents a smooth, non-warping, even surface that will give permanent satisfaction and protection.

Bond

All the requisites for the best belting will be found in ***Bond***—the belt for all difficult drives.

¶ Engines, belts and machinery are all necessary to production. Belts play a greater part than is often realized. Be sure you are getting the ultimate efficiency from your belt. The greatly increased use of ***Bond*** Leather Belts proves that their long life and merit are widely recognized in every industry.

We use the Best Packer Steer Hides, tanned by oak bark process, following the most skilled methods in order to add life and strength.

Write for our literature at once.

"Bond" belts pay the biggest dividends on power transmission investments.

What Builders Need

Established 1868

In their advertising merchants are apt to talk about goods—but listen to their *customers,* and nine times out of ten you will find that they are talking about *service.* It's the great force of modern business.

Lumber sold by different dealers is very much alike; but there is a great difference in *service.*

The best service you can get is none too good. When you build that new factory or store, the important thing is to choose the lumber dealer that will give you the prompt, efficient *service* that to builders so often makes the difference between failure and success.

Some day you will build. If you want the work finished on time, see that the lumber comes from LLOYD.

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

Certified check $3,000.

Indiana County, Routes 223 and 314, East Wheatfield Township, length 25,030 feet. One course reinforced concrete and Hillside vitrified brick. Certified check $4,000.

Jefferson County, Route 64, Union Township, length 14,385 feet. One course reinforced concrete and Hillside vitrified brick. Certified check $3,000.

Lancaster County, Route 129, West and East Donegal, Mt. Joy, Rapho, East and West Hempfield Townships, length 82,576 feet. One course reinforced concrete. Certified check $4,000.

Northumberland County, Route 182, Ralpho Township, length 11,549 feet. One course reinforced concrete. Certified check $2,000.

Potter County, Route 236, Shinglehouse Borough, length 8,358 feet. Either bituminous surface course on concrete foundation or one course reinforced concrete. Certified check $1,500.

Warren County, Appli. 793-4, Route 93, Tinioute Borough, length 12,012 feet. One course reinforced concrete. Certified check $2,500.

Proposal forms and specifications free. Plans, $2.50 per set at State Highway Department ,Harrisburg, Pa.

Road Work, various locations, Pennsylvania. Owners, State of Pennsylvania, care of Lewis S. Sadler, State Highway Commissioner, Capitol Building, Harrisburg, Pa. Bids will be opened at 10 A. M., March 3, 1920, for the construction of the following roads:—

Adams County, Route 298, Cumberland and Freedom Townships, length 29,716 feet. One course reinforced concrete and Hillside vitrified brick. Certified check $4,000.

Armstrong County, Route 188, Kiskimentas Township ,length 10,610 feet. One course reinforced concrete. Certified check $2,000.

Cambria County, Route 222 ,Scalp Level Borough, Richland and Stony Creek Townships, length 24,207 feet. One course reinforced concrete. Certified check $4,000.

Crawford County, Route 82, Vernon Township, length 18,619 feet. Either one course reinforced concrete and Hillside vitrified brick or two courses reinforced concrete and Hillside vitrified brick. Certified check $3,000.

Crawford County, Route 89, East Mead Township, length 18,514 feet. One course reinforced concrete. Certified check $3,000.

Delaware County, Route 131, Concord Township, length 14,992 feet. One course reinforced concrete. Certified check $3,000.

Fayette County, Route 366, Stewart and Wharton Townships, length 26,267. Either bituminous macadam penetration method on broken stone base and Hillside vitrified brick, or one course reinforced concrete and Hillside vitrified brick. Certified check $4,000.

Fayette County, Route 247, Perry and Jefferson Townships, length 14,496 feet. One course reinforced concrete and Hillside vitrified brick. Certified check $2,000.

Lawrence County, Route 81, Pulaski Township, length 28,636 feet. One course reinforced concrete. Certified check $4,000.

Warren County, Appli. 154, Farmington and Pine Grove Townships, length 22,287 feet. One course reinforced concrete and Hillside vitrified brick. Certified check $4,000.

Westmoreland County, Route 68, Derry Township, length 32,047 feet. One course reinforced concrete and Hillside vitrified brick. Certified check $4,000.

Forms and specifications free and plans $2.50 per set, at State Highway Department, Harrisburg, Pa.

Residence, Springfield, Pa. Architects, Hance, Mitchell & Neely, 1619 Chestnut st., Philadelphia. Owner's name withheld. Stone, frame and stucco, 2 stories, 38x40 feet, stone foundations, shingle roof, oak floors, hot water heat, electric light. Plans in progress.

Residence and Garage, Merion, Pa., $25,000. Architect, Ralph E. White, Pennsylvania Building, Philadelphia. Owner, Herbert Taylor, president, Eastern Motors Corp., Broad and Wallace streets, Philadelphia. Hollow tile and stucco, 2½ stories, 28x50 feet. Garage 1½ stories, 20x20 feet, stone foundations, slate roof, hardwood and cement fl oors, hot water heat, electric light, tile work. Plans in progress. Architect will take bids in a few days.

Pennsylvania Contracts Awarded

Rectory, Willow Grove, Pa. Architect, Paul A. Moaghan, 1218 Chestnut street, Philadelphia. Owner, Mission of St. David, care of Rev. Edw. J. Curran, Mineral Springs Inn, Willow Grove, Pa. Stone, 3½ stories, 60x40 feet, slate or shingle roof, pine floors, vapor heat, electric lighting, tile work, iron and concrete work. Contract awarded to Specht & Sperry, Heed Building, Philadelphia.

Academy (alts.), Villa Nova, Pa. Architects, J. J. Kennedy, Wilmington, Del. Owners, Villa Nova College, Villa Nova, Pa. Stone, reinforced concrete, 3 stories, 55x82 feet, hardwood and tile floors, electric lighting. Contract awarded to Jacob Myers & Sons, Witherspoon Building, Philadelphia.

Mill Building, Chester, Pa., $60,000. Architect, private plans. Owners, Allison & Co., Law Building, Chester, Pa. Concrete and steel, 1 story, 60x200 feet, slag roof, steam heating, electric lighting, rolled steel sash. Contract awarded to Chester Const. & Cont. Co., Otis Building, Philadelphia.

Store House (2 parts), Rutherford, Pa. Architect, private plans. Owners, Philadelphia & Reading Railway, Reading Terminal, Philadelphia. Concrete, brick and steel, 1 story, 77x40 feet and 39x40 feet, asbestos asphalt roof, concrete floors, rolled steel sash, fire doors, iron work. Contract awarded to A. Wildman, Harrisburg, Pa.

New Jersey Construction News

School Building, Stevens Station, Burlington Township, N. J. Architect, William A. Klemann, First National Bank Building, Trenton, N. J. Owners, Board of Education, Burlington Township, care of District Clerk, Elwood H. Russell, Burlington, N. J. Brick, slow burning construction, 2 stories)heat and ventilating separate bids). Owners will receive bids due March 1st at 8 P. M. in Mitchell School House, Springside, Burlington Township, Burlington County, N. J. Certified check for $250 for building and $10.00 each for heating and ventilating.

Church, Hackettstown, N. J. Architect, George I. Lovatt, 416 Walnut street, Philadelphia. Owner, Roman Catholic Church of the Assumption, Hackettstown, N. J. Architect taking revised bids due February 24th. Gallo Brothers, Netcong, Pa.; Bechtel & Bechtel, Easton, Pa., and McLaughlin & McNally,

We have pebbles all sizes. Cost less than what you are using. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

Eighty-first and Suffolk avenue, Philadelphia, are figuring.

City Hall (add.), Woodbury, N. J. Architect, Charles R. Peddle, 136 South Fourth street, Philadelphia. Owner, City of Woodbury, City Hall, Woodbury, N. J. Brick, 2½ stories, 24x30 feet, slate roof and general remodeling. Plans in progress.

Schools (2), Nos. 2 and 3, Audubon, N. J. Architects, John H. Mowere and David Lang, Audubon, N. J. Owner, Board of Education, Borough of Audubon, Camden County, care of George N. Hoffman, clerk, Audubon, N. J. Brick and stone, 1 story. Owners taking bids due March 9th, at 9 P. M. (Heating, ventilation, plumbing and electric work separate bids.)

Garages (11), Trenton, N. J. Architects, Fowler & Seaman, Broad Street Bank Building, Trenton, N. J. Owner, Mr. H. Keho, Princeton avenue, Trenton, N. J. Brick and hollow tile, 1 story, 25x100 feet, slag roof, cement floors, hot water heat, electric light. Plans in progress. Owner will take bids.

Garages, Park street, Bordentown, N. J. Architects, Fowler & Seaman, Broad Street Bank Building, Trenton, N. J. Owner, Raymond Robins, Bordentown, N. J. Steel, 1 story, 78x61 feet, slag roof, concrete floors, electric lighting. Owners taking bids.

Club House, Woodcrest, N. J. Architects, Neubauer & Supowitz, 929 Chestnut street, Philadelphia. Owners, Mellody Club, care of Architect. Brick and frame, 1 story, 30x60 feet, shingle roof, steam heat, electric light. Plans in progress.

New Jersey Contracts Awarded

School (add.), Red Bank, N. J. Architect, Charles R. Peddle, 136 South Fourth street, Philadelphia. Owner, Board of Education, West Depford Township, Thorofare, N. J. Hollow tile, 1 story, 30x70 feet, shingle roof, maple floors, stone foundations (heating, electric light, plumbing, extensions reserved). Contract awarded to L. S. Parks, Swedesboro, N. J.

Store (alts. and add.), 203 East State st., Trenton, N. J. Architect, private plans. Owner, Ogden D. Wilkinson, on premises. Brick, 1 story, stone foundations, slag roof, general interior alterations. Contract awarded to Edward Reeger, 1423 South Broad street, Trenton, N. J.

Stores (alts. and add.), 840 Clinton street, Trenton, N. J., $4,000. Architect, private plans. Owner, J. A. Cook, Genesee and Roebling streets, Trenton, N. J. Brick, three-story addition, stone foundations, tin roof, general interior alterations. Contract awarded to Edward Reeger, 1423 South Broad street, Trenton, N. J.

Delaware Construction News

Apartment (alts. and add.), Seventh and West streets, Wilmington, Del. Architect, J. J. Kennedy, Ford Building, Wilmington, Del. Owner, Mrs. M. Doordare, on premises. Brick, 3 stories, 25x70 feet, concrete foundations, slag roof, hardwood floors, electric light, tile work, interior alterations. Plans in progress.

Stores (alt. and add.), Eleventh and West streets, Wilmington, Del. Architect, E. C. Map, Dupont Building, Wilmington, Del. Owner, Realty Association, care of architect. Brick, 2 stories, 15x40 feet, interior alterations. Architect will take bids this week.

Service Station, Penn and Union streets, Wilmington, Del. Architect, E. C. May, Dupont Building, Wilmington, Del. Owner, name withheld. Hollow tile, terra cotta, concrete, 2½ stories, 32x32 feet, slate roof, concrete floors, hot water heat, electric light. Architect has received bids.

Swimming Pool and Dressing Room, Villa Nova, Pa. Architect, J. J. Kennedy, Ford Building, Wilmington, Del. Owner, Villa Nova College, Villa Nova, Pa. Stone, 2 stories, 70x100 feet, stone foundations, tile roof, hot air heat, electric light, tile and marble work. Architect has received bids.

Delaware Contracts Awarded

Theatre, Union street, between Third and Fourth streets, Wilmington, $50,500. Architect, W. E. Hance, Wilmington, Del. Owners, West End Amusement Company, Wilmington, Del. Brick, 40x50 feet, stone foundations, slag roof, concrete and wood floors, steam heat. Contract awarded to Ernest Di Sabatino, 415 Lincoln street, Wilmington, Del.

Stores (2) and Office, Eleventh and Orange street, Wilmington, $20,000. Architect, E. C. May, Dupont Building, Wilmington, Del. Owner, name withheld. Brick, 2 stories, 40x45 feet, stone foundations, tin roof, concrete floors, hot air heat, electric light, tile and marble work, plate glass. Contract awarded to Herbert Brown, 305 West street, Wilmington, Del.

Miscellaneous Construction News

Infirmary, Atlanta, Ga. Architects, F. Ferdinand Durang, 1220 Locust street, Philadelphia. Owner, St. Joseph's Infirmary, Atlanta, Pa. Stone, brick and limestone, 3 stories and basement, 40x150 feet, (2) wings 120x40 feet, tile roof (roof garden). Plans in progress.

Manufacturing Buildings (20), Norfolk, Va. Architects, Neubauer & Supowitz, 929 Chestnut street, Philadelphia. Owners, Norfolk Shipyard Corp., Norfolk, Va. Details undecided. Plans in progress.

NChurch, Parish House and Sunday School, Buffalo, N. Y. Architects, Chas. W. Bolton & Son, Witherspoon Building, Philadelphia. Owner, Central M. E. Church, Buffalo, N. Y. Stone, 2½ stories, irregular size, steam heat, electric light, tile work. Details undecided. Plans in progress.

Repitition tends to create **habit,** the more often we see, do or hear a thing, the quicker we are likely to be influenced by it. The consecutive appeal of a number of advertisements will develop certain memories and associations tending to overcome the natural habit of procrastination.—Making advertising pay.

Woodoleum Flooring

You are safe when you buy a Woodoleum Floor.

You get an absolute and unqualified guarantee. You get a concern which is the pioneer in this line of floor coverings.

There is but one Woodoleum—accept no imitation.

PLANS OF FINANCING HOME BUILDING PROJECTS

Realizing the urgent need for housing throughout the State, the Pennsylvania State Chamber of Commerce has established a Housing Bureau. The work of this bureau will be of an advisory nature and information collected by Ritchie Lawrie, Jr., the bureau chief, has led to the issuing of a pamphlet outlining six plans for community companies.

PLAN NUMBER ONE.

COMMUNITY COMPANIES.

1. *Capitalization.*—The capital funds of the Financing Company to be raised by public sale of certificates of stock. Subscriptions to be made by individuals, estates, commercial and industrial interests. Fifty per cent. of the authorized capital to be subscribed immediately and to be subject to call on reasonable notice.

2. *First Mortgage.*—The home seeker to place a first mortgage with an individual, estate or lending institution. The Financing Company to approve and assist in placing the mortgage. The mortgage to be for an amount equal to at least 60 per cent. of the total cose of the home, including the improved lot.

3. *Second Mortgage.*—A second mortgage to be assumed by the Financing Company for an amount not in excess of 30 per cent. of the total cost of the home, including the improved lot.

4. *Initial Payment.*—The home seeker applying for the loan to have in cash, land or its equivalent an amount not less than 10 per cent. of the total cost of the home, including the improved lot. This payment to be made to the Financing Company at the time the loan is negotiated.

5. *Liquidation.*—Monthly installment payments in amount of not less than 1 per cent. of the total cost of the home, including the improved lot, to be made to the Financing Company by the home seeker to meet the interest charges, to retire the second mortgage and eventually to retire the first mortgage.

6. *Revolving Fund.*—The release of the Financing Company funds due to the retirement of the second mortgage by the installment payments to be available for re-investment.

A. B. SEE ELECTRIC ELEVATOR CO.
507-8 Colonial Trust Building, Philadelphia

ELECTRIC ELEVATORS OF HIGHEST EFFICIENCY FOR EVERY SERVICE.
LET US SHOW YOU.
Both Phones

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

1. *Income.*—The gross income is estimated to be 6 per cent. of the invested capital. After deduction of expenses, such as salaries, office rent, etc., the net income of the Financing Company is estimated to be from 4 to 5 per cent. if the capital is fully invested.

PLAN NUMBER TWO.

COMMUNITY COMPANIES.

1. *Capitalization.*—The capital funds of the Financing Company to be raised by subscription by commercial and industrial interests. Fifty per cent. of the authorized capital to be subscribed immediately and to be subject to payment in specific amounts at certain definite periodic intervals.

2. *First Mortgage.*—The Financing Company to assume at the prevailing interest rate a first mortgage equal in amount to not less than 60 per cent. of the total cost of the home, including the improved lot.

3. *Second Mortgage.*—The Financing Company to assume at the prevailing interest rate a second mortgage equal in amount to not more than 30 per cent. of the total cost of the home, including the improved lot.

4. *Initial Payment.*—The Home Seeker applying for the loan to have in cash, land or its equivalent an amount not less than 10 per cent. of the total cost of the home, including the improved lot. This payment to be made to the Financing Company at the time the loan is negotiated.

5. *Liquidation.*—Installment payments to be made monthly by the home builder at a rate of not less than 1 per cent. of the amount advanced. The payments to begin when the loan is made.

6. *Revolving Fund.*—The Financing Company to sell trust notes to investors, pledging the mortgages as collateral, thus constantly securing additional funds of increasing effectiveness for re-investment.

7. *Income.*—The net income will depend largely upon the rapidity of re-investing the Financing Company's funds. It is estimated not to exceed 6 per cent. of the invested capital.

PLAN NUMBER THREE.

1. *Capitalization.*—The capital funds of the Financing Company to be raised as described in Plan No. 1, Certificates of paid up stock in one or more approved building and loan associations to be purchased as fast as the capital funds are received.

2. *First Mortgage.*—The home seeker, with the assistance of the Financing Company, to place a first mortgage with a building and loan association in which the Financing Company holds stock certificates. The amount of this mortgage to be not less than 60 per cent. of the total funds required.

3. *Second Mortgage.*—The second mortgage as such does not enter into this plan but appears in different form. In case the building and loan association is prevented from assuming the degree of risk represented by the difference between the amount of the initial payment of the home seeker and the total loan, then the Financing Company will assign to the building and loan association certificates of paid up stock of the building and loan association held by the Financing Company. The amount of this assignment to equal the difference between the loan assumed by the building and loan association and the sum required by the home seeker.

4. *Initial Payment.*—The applicant to make an initial payment to the building and loan association at the time the loan is negotiated. This payment to be not less than 10 per cent. of the total cost of the home and the improved lot.

5. *Liquidation.*—The home seeker to make monthly installment payments to the building and loan association in amount equal to not less than 1 per cent. of the funds advanced. A portion of these payments to apply against the interest charges and the balance to release the paid up certificates assigned to the building and loan association by the Financing Company.

6. *Revolving Fund.*—The Financing Company funds to be released for re-investment by applying the installment payments against the certificates of paid stock held by the Financing Company. As these certificates of paid up stock are released they become immediately available for further new loans.

7. *Income.*—The gross income of the Financing Company will amount to the rate of interest paid by the building and loan association on the paid up certificates of stock.

PLAN NUMBER FOUR.

COMMUNITY COMPANIES.

1. *Capitalization.*—The capital funds of the Financing Company to be raised by public sale of certificates of stock at a par value not to exceed $100. Subscriptions to be made by individuals, estates, commercial and industrial interests. Ten per cent. of the total amount subscribed to be paid at the time of subscription and the balance in periodic installments.

2. *First Mortgage.*—The home seeker to place a first mortgage equal to not less than 60 per cent. of the total funds required, with any one of a number of lending institutions approved and recommended by the Financing Company.

3. *Second Mortgage.*—The Financing Company to take as collateral a land contract to cover the amount required to bridge over the difference between the first mortgage plus the initial payment and the total loan. In this plan the home seeker is required to purchase a lot on his own terms.

4. *Initial Payment.*—The home seeker to hold as equity in a lot an amount equal to at least 10 per cent. of the total funds to be advanced.

5. *Liquidation.*—The home seeker to pay to the Financing Company each month an amount equal to not less than 1 per cent. of the cost of the house. These payments to retire the loan advanced by the Financing Company, at which time the land contract will be terminated and the home builder given a deed to the property. In addition the borrower is also required to meet the interest charges of the first mortgage, to pay the taxes and to carry a fire insurance.

6. *Revolving Fund.*—The Financing Company to secure funds for re-investment by negotiating loans and offering the land contracts as security.

7. *Income.*—The estimated gross income with the capital fully invested to be 5 to 6 per cent. per cent. per annum.

PLAN NUMBER FIVE.

INDUSTRIAL COMPANIES.

1. *Capitalization.*—Capital funds to be appropriated by the company or companies entering into the housing project.

2. *First Mortgage.*—In lieu of a first mortgage a demand note at the current rate of interest is given by the employe to the company for the customary first mortgage amount.

3. *Second Mortgage.*—In lieu of a second mortgage the employe gives a time note to the company. This time note to be payable after a number of years at the current rate of interest. For example, a $1,000 note payable in 12 years with interest at 5 per cent.

4. *Initial Payment.*—The employe is required to make a payment of not less than 10 per cent. of the total cost of the house, including the improved lot at the time the loan is negotiated.

5. *Liquidation.*—The employe agrees to purchase the requisite number of shares in a building and loan association or other approved lending institution upon which periodic installment payments are made so that the deposits at the current rate of interest will have matured in a sum equal to the face value of the time note at the date set for payment of the time note. The employe also agrees to carry the loan by making monthly interest payments to the company on the demand and time notes. The company agrees not to act upon the demand note as long as the employe continue to fulfill his part of the agreement; that is, to make monthly interest payments to the company and monthly payments to the lending institution.

6. *Insurance Benefit.*—If the employe should die or become incapacitated within the payment time of the note, provided than in the event of death the employe is not over sixty years of age, the company will accept the cash surrender value of the shares of the lending institution as full payment of the time note. The property will then be free from all incumbrances except the amount of the demand note, which, at the option of the employe of his heirs, may be transferred as a first mortgage to a lending institution.

PLAN NUMBER SIX.

INDUSTRIAL COMPANIES.

1. *Capitalization.*—Capital funds to be provided by the company or companies interested.

2. *First Mortgage.*—The company will assist the employe in placing a first mortgage with a lending institution to cover at least 60 per cent. of the total funds required.

3. *Second Mortgage.*—In lieu of a second mortgage a time note is given by the employe to the company for an amount equal to the difference between the first mortgage plus the initial payment and the total funds required.

4. *Initial Payment.*—The employe is required to make a payment of not less than 10 per cent. of the total cost of the home, including the improved lot at the time the loan is negotiated.

5. *Liquidation.*—The employe agrees to purchase a combination "life-accident" insurance policy and to maintain same in force until paid up, at which time the cash surrender value will be used to liquidate the time note and possibly a portion of the demand note. The employe is required to make monthly interest payments to the lending institution and to pay taxes and carry fire insurance.

6. *Insurance Benefit.*—In the event of death of the employe or injury to the extent of causing partial or total disability the compensation paid by tyhe insurance company will be available to pay off the time note and possibly a portion of the demand note. The property will then be free of all incumbrances except the first mortgage.

* * *

THE EFFECT OF TOO MUCH WATER IN CONCRETE

By DUFF A. ABRAMS

Concrete is made of a mixture of three materials of entirely different characteristics—cement, aggregate and water. These materials, or any two of them, may be mixed in all proportions; however, it is only a certain range of possible mixtures (which must include cement and water) that is useful as a structural material. A certain proportion of cement must be used in order to secure the requite strength; a certain quantity of water is necessary in order to develop the hydraulic properties of the cement and to produce a plastic mix; economy dictates the use of aggregate in the mix.

Experience has indicated about what proportions of cement and aggregate must be used to give concrete the necessary resistance for a given purpose, but little attention has been given to the inter-relation of the effects of varying quantities of water on the resistance of the concrete.

A thorough investigation of this subject is in progress at the Structural Materials Research Laboratory. These tests have shown the following relations to obtain:

1. With a certain aggregate of the same grading and sufficient water to produce a concrete of a given plasticity, the strength of the concrete, within the usual range of mixes, is proportional to the quantity of cement in a unit volume of concrete.

2. With a given aggregate and the same quantity of cement, the strength of the concrete is a maximum with the smallest quantity of water which can be used to produce a plastic mix; any increase in the quantity of water is accompanied by a very rapid falling off in the strength of the concrete.

3. With a given aggregate mixture, the same quantity of cement, and sufficient water to produce a concrete of definite plasticity, (a) the strength of the concrete increases with the "coarseness" of the aggregate up to a certain limit; (b) this limit of "coarseness" is higher for a larger quantity of cement and lower for a smaller quantity of cement; (c) the limit of "coarseness" of the aggregate which it is feasible to use varies slightly with the character of the material, being somewhat lower for a mixture of sand and crushed stone than for sand and well-rounded pebbles, and still lower for mixtures in which crushed stone or similar material is used as fine aggregate.

4. For given proportions of cement and aggregate, the quantity of water required for a definite plasticity depends largely on the grading of the aggregate and to only a minor degree on the character of the material, shape of particles, etc.

5. For a given aggregate, the quantity of water required to give concrete of the same relative plasticity is directly proportional to the quantity of cement.

If we assume that concrete materials of suitable character are at hand, and that mixing and other details are properly cared for, the engineer generally has the following alternative for improving the quantity of the concrete:

a. More cement.

b. Coarser aggregate (within certain limits).

c. Less water (limited by the necessity of producing a plastic mix).

Economy dictates the use of the smallest quantity of cement which will produce concrete of the desired resistance. The tendency has been during recent years to use entirely too much water; in many instances the water used is 50 to 100 per cent. in excess of the quantity which gives the highest strength, resulting in concrete of not more than 25 to 50 per cent. the strength that should have been obtained with the same cement and aggregate and a proper quantity of water. While some sacrifice in strength is generally necessary in order to secure concrete which may be handled and placed at low cost, it is absurd to sacrifice 50 to 75 per cent. of the strength which is practically available in this way. While the injurious effect of excess water in concrete has been given little attention, a great deal of emphasis has been placed on the benefits to be derived from the use of coarse, well-graded aggregate.

The experimental work referred to above has already thrown much new light on this subject. We are forced to the conclusion that the chief advantages of well-graded and coarse aggregate as compared with poorly-graded aggregate come from the fact that *the concrete can be mixed to a workable plasticity with less water,* and not to any inherent difference in the behavior of aggregate of different sizes. In other words, while coarse, well-graded aggregate is highly desirable, *little or nothing is gained by using aggregates of the highest grade unless we take advantage of the fact that it can be mixed with correspondingly less water.* This makes it apparent that many of the shortcomings of concrete made of fine or poorly-graded aggregate should be charged to the additional water required to mix the concrete.

It is as important that an upper limit be placed on the quantity of water as it is that a lower limit be placed on the quantity of cement in the batch. It would be just as consistent to specify the quantity of aggregate and water and leave the proportioning of the cement to the judgment of the mixer foreman, as to specify the quantity of cement and aggregate and leave the proportioning of the water to the mixer gang. Exactly the same effect is produced by the use of an excess of

Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

water as by deficiency in cement; and it is more important now that special attention be given to the water in concrete, since the present methods give reasonable assurance that the proper quantity of cement is used.

All the benefits which may arise from using good cement, coarse, well-graded aggregates, thoroughly mixing the concrete, etc., are completely nullified if an excess of water is used in the mix.

"In mixing concrete use the least quantity of water that will produce a workable mix, then give the concrete as much water as possible after it has begun to harden," is the only safe rule to follow. The amount of water which should be used with given materials cannot always be determined in advance; it will also vary with the nature and size of the work. However, every effort should be made to keep the water content of the concrete at a minimum. It is not feasible to use the quantity of water corresponding to the highest possible strength of concrete (a similar statement may be made with reference to the "coarseness" of the aggregate), yet this difference should be reduced to a minimum by using the smallest practicable amount of water.

The abuse of the water element in concrete has come about solely from the fact that it is cheap, and frequently facilitates handling and placing. Much of the concrete which is being made at the present time could be greatly improved, at no additional cost, if the owner were compelled to pay, say, one-half to one cent per gallon for all water going into the mixer. In many respects it is unfortunate that water is not an essential element in the cost of concrete.

Probably the greatest improvement which can be made in our present methods of manufacturing concrete will come from a better understanding of the very injurious effect of excess water and a saner practice in proportioning this important element of the mix.—*Concrete Highway Magazine.*

ESTIMATING BRICK WORK

By I. P. Hicks.

Brick, as made by different manufacturers, vary in size and, of course, there is sure to be more or less variations in the actual quantities required for certain jobs; the variations depending upon the size of the brick and the size of the mortar joints made in laying the brick, says I. P. Hicks in the *National Builder.* For the purpose of estimating we will assume as near as we can the average size of brick as we find them on the market. For the common brick we will assume it to measure 8¼x4x2½ inches and that the wall is to be laid up with 3-8-inch mortar joint.

For this kind of a wall figure 6 brick to each suare foot of wall for every 4-inch thickness of wall. Thus, for a wall 4 inches thick, figure 6 brick per square foot; for an 8-inch to 9-inch wall, figure 12 brick per square foot; for a 12 to 13-inch wall, figure 18 brick per square foot; for a 16 to 17-inch wall figure 24 brick per square foot and so on, adding 6 brick for each 4-inch thickness of wall.

To be very accurate in the number of brick required, deduct the brick required for all openings. In small foundation work, where there are only a few small cellar window openings, it is hardly worth while to deduct the openings, but for the main windows and doors in a brick building, it becomes necessary to deduct the brick for openings, otherwise the result would be far too many brick.

BRICK FOOTINGS.

Brick footings, based on steps or offsets of 2 inches, may be estimated by the lineal foot, as follows: For a 9-inch wall, 2-course footing, 10½ brick; 13-inch wall, 3-course footing, 22½ brick; 18-inch wall, 4-course footing, 39 brick; 22-inch wall, 5-course footing, 60 brick; 26-inch wall, 6-course footing, 85½ brick.

PRESS BRICK.

For a standard size of press brick we will assume the following dimensions: 8¼x4x2¼ inches, and the mortar joint to be ¼ inch. This will require 7 brick per square foot for every 4-inch thickness of wall.

MORTAR FOR BRICKWORK—LUMP LIME MORTAR.

The quantity of material required to lay 1,000 brick with a 3-8-inch joint, using 1 to 2 lime mortar, composed of 1 part lime putty to 2 parts sand, will be 1¾ barrels of lump lime and ⅝-cubic yard of sand.

HYDRATED LIME MORTAR.

For mortar composed of 1 part hydrated lime and 2 parts sand, figure 6½ 50-pound sacks of hydrated lime and ⅝-cubic yard sand per 1,000 brick.

CEMENT MORTAR.

For 1 to 3 cement mortar composed of 1 part Portland cement and 3 parts sand, figure 5 sacks of cement and ⅝-cubic yard of sand per 1,000 brick, with a 3-8-inch mortar joint. Approximately 2½ bags of cement and 1-3 of a cubic yard of sand will be required if laid with about a ¼-inch joint.

CEMENT AND LIME MORTAR.

Figure 1 sack of Portland cement, ¾-barrel of lump lime and ⅝-cubic yard of sand per 1,000 brick laid in the wall with a 3-8-inch mortar joint.

Estimating Brick for Chimneys.

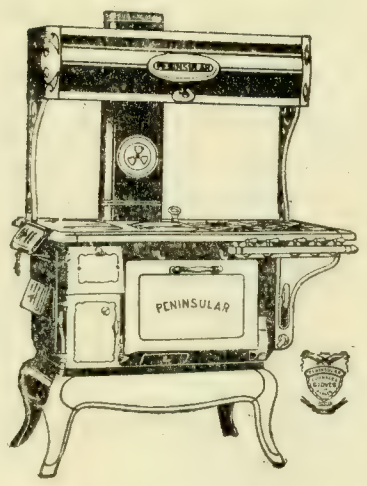
SIZES GIVEN ARE INSIDE OF FLUE MEASURE.

8x8 flue, 24 brick per lineal foot.
8x12 flue, 28 brick per lineal foot.
12x12 flue, 32 brick per lineal foot.
12x16 flue, 36 brick per lineal foot.
16x16 flue, 40 brick per lineal foot.
8x8 double flue, 40 brick per lineal foot.
8x8 and 8x12, two flues, 44 brick per lineal foot.
8x12 double flue, 48 brick per lineal foot.
8x12 and 12x12, two flues, 52 to 56 brick per lineal foot.

Chimney breasts for fireplaces and mantels require 90 to 110 bricks per lineal foot the height of the chimney breast. Where the chimney is reduced in size above the breast, figure according to the size and number of flues from there to the top as given above. These figures should enable one to arrive at a very close figure as regards the number of brick required. In the above figures no allowance has been made for any waste in brick and it would be proper to allow a small percentage for broken and wasted brick. If the brick are of good quality, 3 to 5 per cent. ought to cover all the waste in handling and laying.

LABOR COST OF LAYING BRICK.

The labor cost of laying brick varies according to the wall, the bond and the kind of mortar joint made. Common brick laid with common bond and plain cut joints; a bricklayer, with one tender, should lay 1,100 brick per 8-hour day, using cement mortar, and 1,350 using lime mortar.



For walls laid in common bond with struck joint one side and plain cut joint on the other side, figure 1,000 brick per 8-hour day, using cement mortar, and 1,200, using lime mortar.

For face walls laid up with selected common brick in common bond with V-shaped mortar joints, or with joints raked out, figure, per 8-hour day, 900 brick, using cement mortar, and 950, using lime mortar.

Face walls laid up with press brick or face brcik where there are panels and pilasters, figure 350 to 400 brick per 8-hour day.

For plain walls laid up with press or face brick, figure 700 to 800 brick per 8-hour day.

Figure laborer's time same as bricklayer's time where there is but one bricklayer working; if two bricklayers are working, figure ½ hour laborer's time to 1 hour of bricklayer's time.—*The Clay Worker.*

A Few of the Reasons

why you should install the **Peninsular Combination Range:**

A Range that burns either Gas, Coal or Wood without any changing or removing of parts—separate or both at the same time—whose oven is always ready for instant use.

A Range that takes up no more space than an ordinary kitchen range, bakes and broils perfectly under all conditions and gives a lifetime of such service.

A Range that makes the kitchen cool in Summer, warm in Winter—beautiful in design, substantial, and easy to keep clean. Secure our prices.

Brownstone Bricks

2,000,000 at $16.00 f. o. b. Reading Sidings.

These are high grade pressed bricks, manufactured of crushed stone and hydrated lime. Greater crushing strength and lower absorption than burned clay. Uniform in shape and size. No soft ones. They are beautiful, economical and everlasting.

Red, Gray & Buff Face Bricks

A complete range of colors. Manufactured of vitrifying shale and fire clay. Our prices defy competition.

Straight Hard, Stretcher and Salmon Bricks

All Shale Bricks in carload lots, delivered on job at competitive prices. We are shipping 200,000 bricks daily to 28 building operations.

Vitrified Paving Bricks

Standard specification pavers at lowest market price.

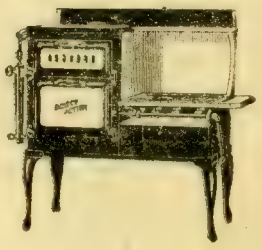
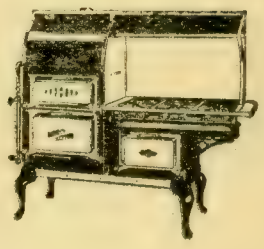
One of the many "reasons why" so many homes in and near Philadelphia are being equipped with the

Direct Action Gas Range





is that its patented oven heat regulator eliminates all guess work in cooking and enables one to obtain the same results at all times. It SAVES GAS, TIME, FOOD and WORRY!

We have it connected up with gas on our sample floor and shall be glad to have you and your clients call any time to witness a demonstration. An attractive booklet showing the entire line is yours for the asking.

BORDEN STOVE CO., 1311-1313 Arch St., Phila.

The Touraine Apts, 1520 Spruce street; the Daniel E. Hogan Operations at 54th and Wynnefield avenue, and 60th and Columbia avenue; the William Pilton Operation at 5959 Larchwood avenue; and the Presser Operation at Yeadon, Pa. are a few of the many operations which are enjoying the advantages of the DIRECT ACTION GAS RANGE.

As The Editor Sees It

AT the present writing the only thing we can think of which has not gone up in price is "Talk." Therefore, we are still discussing ways and means of reducing the high price of everything, but so far with very little result. It seems perfectly plain and simple to understand that every time a wage earner demands an increase in wages it sends the cost of living—*his* living not excepted—up a peg higher; we say this seems plain and easy to understand—we should add for every one except the wage earner in question.

However, one thing is certain. Until Labor is educated to a proper understanding of the important part which strikes, under-production, ever-increasing wages, etc., play in causing the H. C. of L., nothing very definite can be accomplished.

No doubt progress is being made. Large plants through the country are educating their employes and are overcoming the insidious Bolshevist tendencies now inculcated in so many workingmen. But the struggle is only begun, and the race will be to the patient and long-suffering, not to the swift.

In the meantime, we still hear news of strikes and demands for higher wages. An account of a peculiar building trades strike is given in *Building Industry.*

A strike of carpenters, says that organ, in which no contractor is involved is a rarity, but this rather odd condition has arisen in Cleveland, where approximately twenty-five carpenters in the employ of the Board of Education have left their work because of a dispute regarding wages. The fact that all of the carpenters who are on strike are civil service employes, appointed to their positions from the regularly certified lists submitted by the Civil Serevice Commission of the city, adds another peculiar phase to the controversy. The carpenters were employed by the Board of Education principally as maintenance men for the care and repair of the large number of buildings under the control of the educational department of the city, and in some instances have been employed to do jobs of considerable extent which would probably have been let to contractors except for the policy of employing the men direct. Whether or not this policy is a proper and economical one is open to grave doubt—in any event the Board of Education is now finding out that the direct labor policy has some disadvantages.

For a number of years it has been the custom of the Board to fix the wages to be paid carpenters at the same rate as established by agreement between the Carpenters' Union and the Carpenter Contractors' Association of Cleveland. The Cleveland established rate is ninety cents per hour; although, because of a great amount of work and a consequent shortage of carpenters, the prevailing wages for carpenters throughout the city is somewhat higher. The Board takes the position that it has agreed with its employes on a scale of ninety cents per hour until May 1st of this year, when the agreement between the contractors' organization and the union expires, and that until the established scale is changed by agreement between the union and the contractors' organization the carpenters in the employ of the Board should receive not more than the fixed rate. The unions maintain that the prevailing rate of wages in the city is higher than ninety cents and that because most contractors are paying a higher rate and one small contractors' organization has agreed to a higher rate, its members employed by the Board should be given an increase in wages.

There has been no change in the scale agreed upon by the Carpenter Contractors' Association and the Carpenters' Union and, if the carpenters employed by the Board of Education were hired with the understanding that they would work at the rate fixed in the agreement, there is no question but that the compact made between them and the Board has been violated by the strike and they should be returned to work immediately.

Different plans for arbitrating the controversy have been proposed by the Board of Education and the Carpenters' Union, and in the meantime the men who were ordered to quit jobs where they can earn more in a year at ninety cents per hour than the average carpenter can earn at a considerably higher rate are the sufferers.

RESOLUTIONS opposing the collective bargaining bill introduced in Congress by Representative M. Clyde Kelly were adopted at a meeting of the Master Builders' Exchange of Phila

The bill, introduced by Mr. Kelly, of Pennsylvania, reads:

To provide for collective bargaining between employers and employees in all industries engaged in interstate commerce.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the refusal of any individual, partnership, firm, corporation, or association engaged in interstate commerce that engages and uses the services of any employe or employees for wage, salary, or other valuable consideration, to bargain collectively with such employees, through their duly chosen representatives, is hereby declared unlawful.

Sec. 2. That the denial or abridging of, or interference with, by any such employer engaged in interstate commerce, the right of employees to organize in trade unions; the denial or abridging of or interference with, by any employee, the right of such employers to organize in associations or groups; the discharge by any such employer of employees for membership in trades unions or for legitimate trade union activities, and the use by any employees of coercive measures to induce persons to join their organizations, are hereby declared unlawful.

Sec. 3. That any person who shall violate the provisions of the Act shall be guilty of an offense, and upon convictions thereof by a court of competent jurisdiction shall be punished by a fine of not less than $1,000, nor more than $5,000, or by imprisonment for not more than one year or by both such fine and imprisonment.

The members of the Exchange unanimously condemned the bill as un-American and urged all commercial and industrial bodies in the city, as well as other Builders' Exchanges in the United States, to co-operate in a fight to defeat it.

IT is interesting to note in this connection that the National Association of Building Trades Employers virtually commits itself in its "platform" to collective bargaining between employers and workers.

The aims of this association, in addition to the objects specifically declared in its constitution, are of the highest order.

We stand, says the association, for the complete elimination of jurisdictional disputes, and in this behalf we insist upon the proper revision of present jurisdictional decisions and awards to eliminate overlapping and conflicting claims, and we further insist upon the right of the employers of building mechanics to participate in the revision of jurisdictional decisions and awards, and that all future jurisdictional questions and claims shall be decided by a properly constituted board made up of representatives of this organization and its employees, and we demand that pending the disposition of a jurisdictional claim by the board to be so created, there shall be no cessation or stoppage of work, and that the contractor shall use whatever mechanics he may desire for the erection of work in dispute until a final decision is rendered, and that when a final decision shall have been made, all parties must conform to and abide thereby.

The promulgation of a uniform National Agreement with respect to the terms and conditions of employment; wages and hours to be determined by a zone system.

To require by an agreement between the members of this organization and their employees the settlement of all disputes of every kind and character by arbitration without any cessation or stoppage of work.

To organize associations of contractors in every industrial community of importance throughout the country to the end that, in the shortest possible time, this association, through the affiliation of national, State and local organizations, shall become representative of and have jurisdiction over the greatest possible number of contractors.

We further declare that this association is not organized as an instrument of oppression for either employer or employee, but that its purpose shall be to promote the best interests of employers, employees and the public.

We further declare that the association stands for fair dealing and for a full measure of respect for the equitable rights and privileges of all parties concerned, and for the promotion of the policies of this association, and the consummation at the earliest possible moment of its objects, we ask for the earnest, enthusiastic and loyal co-operation and support of good citizens of every trade in general and from contractors and building mechanics in particular.

COSTS AND BETTER CONTRACTING

Complete Records of Cost Are Invaluable in Estimating and in Promoting Efficiency

By H. G. CHRISTMAN, President, H. G. Christman Company.

An accurate system of cost accounting has been an important factor in the growth and prosperity of the H. G. Christman Company, and the value of this feature of the contractor's organization deserves great emphasis. The builder must know what the various elements of one job have actually cost before he can prepare a logical bid upon another. Guesswork has no place in modern industry.

In the system that our organization has developed, materials and labor are estimated under fixed general divisions and their sub-divisions. Reference is made, of course, to our cost records on previous jobs, and an excellent idea is obtained of both the amounts to be charged against the various parts of the work and of the time required for its completion.

Then during the progress of the work costs are kept according to the same schedule of items as was used in making up the estimate. A schedule has been prepared which first lists the general headings, with their divisions, and then states briefly the nature of the items that are to be charged under each. Copies of this cost distribution schedule are placed in the hands of the superintendent on each job, with the necessary forms for keep an accurate and complete set of costs. Unnecessary refinement is eliminated, but some detail is necessary in order that the desired figures may be secured.

At the completion of the job, comparison is made between the estimated and the actual costs, and the superintendent is paid a bonus in proportion to the savings he has made. He in turn shares the bonus with the various foremen working under him, on a predetermined basis. At the beginning of the job each foreman is given an estimate of the labor cost, only, on the work that will fall to his men, so that he can always tell whether the work is being done within the estimate, and yet he does not have details as to the total cost of each part of the job.

The bonus is made a liberal one so that a strong inducement is offered to those in direct charge of operations to put forth every effort in securing a good output from the workmen and in developing more efficient methods. The success of such a bonus system hinges upon adherence to fair standards when the estimates are prepared, so that under careful supervision savings worth while can be made. —*Bulletin of Associated General Contractors.*

Cheapest and the best

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

With Any WALL Covering Made—

Sheetrock is more than wall board—it is better than wall board, for it is plaster in wall board form.

Made of fireproof gypsum rock, sandwiched between mineralized sheets of paper, Sheetrock provides just as safe a wall and ceiling covering as metal lath plastering.

Take samples of other wall boards and test them with a match. The result will show why Sheetrock was preferred by the U. S. Government for its army cantonments.

Compare Sheetrock in thickness with ordinary wall boards—it is nearly twice as thick. Try to break it, scratch the pure gypsum rock center, drive a nail thru it. Every test will prove the superiority of Sheetrock.

Sheetrock insulates heat and cold, for it is a non-conductor. Therefore it will save coal in winter and discomfort in summer—that means permanent satisfaction.

With Sheetrock you can overcome delays caused by late deliveries of material, by slow ripening and drying of plaster **and by** labor difficulties.

Sheetrock saves time and money.

Plans or No Plans

There are two classes of builders who need the help of a strong, modern lumber centre,—those who have *planned* their operations well, and those who haven't.

If you have planned well, you will need a strong organization to help carry out your plans. The best is none too good. In big building operations, all of our experience and resources, including the powerful aid of our Traffic Department, are constantly required.

But if you have *not* been able to make careful plans; if you are forced to build hastily and under pressure, then only an uncommonly strong organization will enable you to accomplish your purpose. When you need unusual stocks or service that you have no right to expect, then the resources of the LLOYD organization will often save the day for you.

Some day you'll build. If you want the work finished on time, see that the lumber comes from *LLOYD.*

Established 1868

WILLIAM M. LLOYD COMPANY

Contract awarded to Schwartz Bros. Co., Bridgeport, Conn.

ELEVATOR HAZARDS AS APPLIED TO THE GENERAL PUBLIC

By Dana Webster,

Safety Inspector for the Aetna Casualty and Surety Company, Indianapolis, Ind.

BEFORE taking up in particular the safety of elevators, it might be interesting to cover briefly the gradual development in the manufacture of mechanical lifting devices.

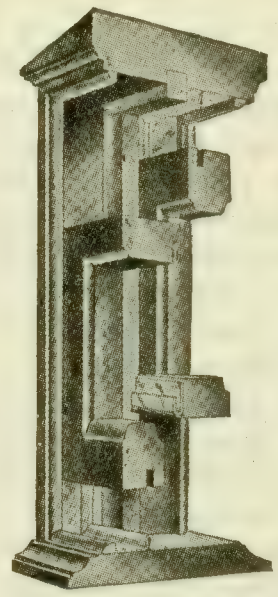
Lifting devices were undoubtedly used by Julius Caesar, as far back as 256 B. C., as history mentions the lifting of animals from the dens to the arena in the Colosseum of Rome. About the middle of the Nineteenth Century, platsforms or cable-hoisted elevators were first installed in New York and Boston, but were not provided with any kind of safety devices, and, strange to say, you can find a few elevators without safety devices even at the present time.

A few years later elevators were equipped with safety devices of such type that it was necessary for the hoist cable to break before the safety could actuate. There are a great many of this type of safety in use today, but with the introduction of high speed elevators, which were required to meet the demands of the public, quite naturally it necessitated a much better type of safety apparats and a multiplicity of cables.

Accidents could and did occur from over-speeding elevators caused by disarrangements of the controlling apparatus, an it became necessary to provide safety devices that would actuate should the elevator speed increase beyond a predetermined number of feet per minute.

The most essential elements of safety are the prevention of excessive speed from any cause, the overrunning of the limits of travel at top and bottom, safe protection at the landing entrances to the elevator and a regular examination of the cables and all parts of the elevator equipments.

The early type of the safety device was designed to stop the car instantaneously. They served the purpose satisfactorily for slow speed, but were not adequate for the higher speed of 400 to 700 feet per minute. It, therefore, became necessary to provide a safety device that would stop the car with an easy and gradual stop. This is accomplished by the friction clamp safety, which is actuated by a safety speed governor, usually set to trip at 40% above regular speed. This governor will act should the hoist cable break, allowing the car to drop, or should the car over-speed from some defect in the machinery after the governor trips and the car has dropped far enough to take up the clearance of the safety jaws. The jaws are forced hard against the guide rail (like a vise) and the car will continue to slide until the friction is enough to stop the car entirely. The distance the car will slide after the safety takes hold depends upon the load; but the further the car slides the tighter the safety grips the rail. Usually a car will drop about six feet after the governor trips and clamps the governor cable.



The Over-Running of Limit Stop.

The machine of all power operated elevators should be equipped with automatic limit stops; that is, a device that will stop the elevator at the top and bottom limit of travel, regardless of the operator.

On drum machines, the automatic limit stops should be built with and made a part of the machine.

On hydraulic elevators, the automatic limit stop should consist of a cut off valve, either in the to-and-from pipe, or in both the supply and discharge pipe.

On traction type of elevators, the automatic limit stops must be located in the

hoistway, and the power cut off by the travel of the car. As there is more or less slippage of the hoist cables on the drive sheave, a machine automatic would not be dependable. In addition to automatic limit stops on electric elevators, there are hoistway limit switches located so that should the car travel a certain distance by the automatic limit stop, the car would open a switch, thus cutting off the power and stopping the machine.

The early types of passenger elevators —and in fact most elevators up to the present time—are provided with landing doors equipped with a catch located on the inside so that the door can only be opened by the operator. The operator, however, in order to make speed—and the public is partly to blame for this—starts the elevator before the door is closed, and quite often the door would not fully close and latch, thus providing a very dangerous condition. Many persons have opened the door when finding it ajar, and looking in the hoistway have either fallen or have been knocked down the hoistway by the car, and severely injured or killed. I might say right here that statistics show that 85% to 90% of all elevator accidents occur at the landing doors. Therefore, it became necessary to provide the landing doors with a locking device that would prevent the doors from being opened, unless the car was at a landing; also to prevent the car from being raised or lowered from the landing until the landing doors were closed. This is termed the interlocking device, or interlocks for landing doors. While I believe all landing doors of passenger elevators and gates for freight elevators should be equipped with interlocks, I am sorry to say that at the present time only a small percentage of elevators are equipped with this device, although they are becoming more and more in general use.

Cables.

The cables are the most essential parts of the elevator equipment, and their number and size should be equal to the load with a good factor of safety. The sheave should be of ample size and placed in alignment to prevent chafing of the cables on the sides.

A great many elevator accidents are not due to faulty design in construction, machinery, or safety device, but to the carelessness of the injured party. It, therefore, becomes necessary for the city or State to enact ordinances and laws regulating the construction of elevators, and enforcing their equipment with effective safety devices, in the interest of accident prevention; that is to say—to prevent a person from being injured by his own carelessness, and also by the carelessness of the operator.

Careful Inspection a Requisite.

"Are the safety devices kept in proper condition" is one important feature. The only way this can be accomplished is by having the elevator regularly inspectted by a competent elevator inspector, who should inspect all the different safety devices, machinery, cables, etc., in fact everything pertaining to the elevator. The landing doors should be tried to determine whether they can be opened from the outside. The car safety device should be tested to be sure that it would actuate and hold the car from falling, should the cable break. The automatic limit stops should be tested so as to be sure the car will not over-run and strike the overhead beams or bumpers. The slack cable device should be tested to be positive the power would be cut off, should the cables slacken. The brake should be examined to be sure there is no slippage. The cables should be examined very carefully for defects, as there is no part of the elevator that requires the exercise of more good judgment than the examination of the cables. It is just as essential that the safety devices, and all parts of the elevator, be kept in good working order, as it is that they should be installed in the first place. After an inspection has been made, the owner should proceed immediately to install safeguards and remedy any defects reported.

The elevator should be oiled and greased regularly by the engineer and looked over carefully for any defects, and not wait for an inspector to make a thorough inspection, and oftentimes the engineer will discover some little defect which if fixed immediately may avoid a serious accident.

There is another feature that I wish to mention before closing; that is the elimination of mirrors, in fact all glass, from the passenger cars—except the electric light bulbs—not only because of the fact that they are liable to cause injury to passengers by getting broken, but also because of their attraction, which results in passengers failing to notify the operator promptly as to their destination. This necessitates a stop between floors, and a trip back to let them off. They also have a tendency to retard the loading and unloading of the cars.

ESTIMATING

By Cyrus J. Parker.

There is no question in my mind but what we all make errors in estimates. As a matter of fact, when we get a job that is when we begin to wonder where we have made our error. I have heard fellows say: "How in the devil did I make my mistake?" they feel that contracts are let on errors, judging from the amount of money the contractors claim they have left when they complete their work. You will find in estimating that a man will have to make up a system of his own. I think that every man's method of contracting is peculiar to himself. It would be impossible for me to lay down such a system for another man, while I might take the system I have worked out and be very successful with it. You can buy trade accounts and hand books on estimating, and the majority of them I have read I would not give the snap of my finger for. The work is always different. You never have two pieces of work that cost the same, with all the different classes of architecture.

I just wanted to call your attention to a few methods of estimating. I happened to spend a few years in Louisiana, and I knew a contractor there in particular who put in his estimates on the basis of cubing or squaring a foot in figuring on it. He is not in business any more. It also reminds me of a fellow who secured a set of plans that were quite bulky, and after looking them over handed them to his partner saying: "Take these damn things and go and weigh them and we will put it in." I know another contractor who claimed he could take a set of plans home in the evening and bring down a figure the next morning. He does it and it is remarkable how close he comes to the value of it. But personally I would not want to risk that kind of a method. For my part I would rather take all of the quantities off in detail and base the estimate on some method of cost keeping that we might adopt. Each one would have to do it to suit himself. There is one advice I would like to give, however, and that is, if you keep a cost system, do not keep it in such a cumbersome manner that you can not handle it. I knew a contractor in Portland who did a large business but used a worn out cost system, and he could not use it any further and he went broke. To my mind, after you have a cost system worked out, you must have it in simple form so that you can combine it with good business judgment and the experience you have had in previous work, basing your estimate accordingly.

In estimating a plan it is necessary to find everything on it. If you do not, you may find after you have signed the contract a few lines of notes on the specifications that may cost you hundreds of dollars. I heard of a fellow who was

Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

constructing a building and noticed the initials "T R" in all the doors on the plan. After he had the building plastered came around and asked him where he was going to put the transoms. His answer was: "There are no transoms on this building plan." The architect said, "Yes, there are. Let me have the plan and I will prove it to you." He proved it to him as he had "T R" on every door. After that experience the contractor always looked for all the T R's on the plan in every contract he secured.

I happened to be brought in on an arbitration at one time where the contractors figured from a large plan one-eighth of an inch scale drawings. They had a large marker there, and from the elevation you might have struck there was a cornice around it that might have been of ordinary galvanized iron. The contractors presumably figured on some character of cornice on the outside. After the contract was signed and the building partially completed, the details showed a heavy cast iron cornice around the outside and cross beam incased in cast iron. The cast iron alone cost $1,100. The arbitration committee allowed the contractor for that. But it is evident that in figuring a plan we should not take the chance with ⅛ inch scale drawing and put in a figure where we stand the chance of losing money as this man did. And even if he did get the money allowed him by the arbitration board there was trouble and dissatisfaction with the architect and all concerned. It is best to ask for details. Some contractors seem to think if you go to an architect and ask for details he will think you do not know your business. I think that is a part of their business; that is what they are getting paid for, furnishing details so a man can figure intelligently on a plan and not take a chance.

Another thing! An architect frequently resorts to generalities in his specifications, such as "according to the satisfaction of the architect, and "in first-class workmanlike manner" and "materials the best quality." Those are a few and there are many others that they put in specifications to which you have to give consideration in estimating. How is a contractor to know the specific temperamentalism of an architect when he wants it done to the satisfaction of the architect, when he does not know what will satisfy the architect? So there should not be a general item of that kind in the specification.

There is not one contractor in a hundred who reads the clause, "materials of best quality" and realizes the interpretation than an architect intends to place on it. These must all be considered in estimating. If you do not do so, an architect, if he is inclined to be unscrupulous, could make it very unpleasant for a contractor. And then comes the old clause saying: "This is intended to be a complete job, supposed to include everything necessary even though it is not particularly mentioned." Half of the plumbing might not be mentioned. But the part that is not mentioned, must be put in, if you have that kind of a specification. You must consider all these items in compiling your estimates. They are just as important as taking off the quantities. In fact they are often more important.

There is another thing: In the past many contractors resorted to asking sub-bids on their work. Possibly at the present time many do this and possibly many may do so in the future. They act on the sub-bids they get and guess at the rest. A lot of them take sub-bids, and immediately after they have been awarded the contract, the contractors forget the sub-bidder who gave the bid and wasted time on it, and immediately start out to find more after having taken the time of the original sub-bidder. Another method practiced by a contractor I once knew, whom I should say is out of business at this time, was to take sub-bids and revise them five per cent., saying he would beat the sub-bidder out of that much and that would make his regular bid five per cent. lower than the rest of the general contractors.

It seems that it might be possible for contractors to get together and adopt some system of quantity surveying. We would not need to make it a guaranteed survey but employ some man in the association. We would not be bound to use the figures of the survey, but it could be used as a check against the quantities we take off. It seems to me that we might work up something along this line that would be beneficial to contractors generally. It is not practical for contractors to take the immense risks taken by them in the past. Contracting is just as legitimate a business as any mercantile business carried on in a legitimate manner and I would favor the establishment of a method of opening up bids that would prevent any increase being made to them before they are put in. It is possible to select one out of the association and turn all the bids over to him and let him check them or audit them in a way, and if he finds an error let him refer it back to the original bidder. It would would be a check on his estimate and at the same time it would be playing the cards on the table. We have passed the stage where we can play other than the square game. The old time contractors who played the game of opening up figures and adding a certain amount to them have lost all the money they made on that method of figuring.

I believe that is about all I know about estimating. The chances are that I follow about the same method the rest of you do. However, I believe the contractor should prepare himself so that he would take the entire quantities from the plan and not be tied up to a sub-contractor. I think, as a matter of fact, the contractor who plans to take all of the quantites off himself is in a better position to take the figures after he has the job than he is before the job is awarded.—*Architect and Engineer.*

WHAT MAKES SUCCESS.

By Charles Grant Miller

Select a dozen of the most successful men you know. They will show every possible variation in their physical and mental characteristics.

They will include tall and short, fat and lean, brunette and blonde, handsome and homely. There will be among them Americans, Englishmen, Frenchmen, Irishmen, Germans and Canadians. Some are young, others middle-aged and some past the meridian. Their weights will run from 105 to 250 pounds.

Mentally the differences are just as great. There will be optimists and pessimists, brilliant talkers and silent men; some nervous and fussy and others with poise; some buoyant and others sedate; some fond of companionship, others solitary; sme are neat, others careless, and they dress in all degrees of fashion. They differ just as widely in intellectual attributes as they do in physical characteristics.

Of course, there are pronounced qualities that count decidedly against a man, and there are other qualities that count strongly in a man's favor. But every day almost we see the man with the unfavorable qualities winning out, and the man with everything in his favor failing.

It always has been so.

Then, what is it, lying deep within the man and hidden from the surface, which impels him to success?

It is not environment—not what we commonly call opportunity. The greatest successes in history and in every-day modern business are achieved by men whose environment was unfavorable, apparently, and who had no opportunities that were visible except through their own peculiar vision. Their opportunities lay within themselves, not outside.

Philadelphia

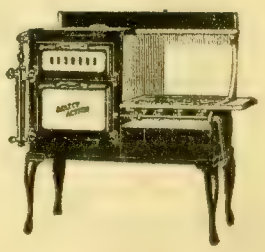
One of the many "reasons why" so many homes in and near Philadelphia are being equipped with the

Direct Action Gas Range



is that its patented oven heat regulator eliminates all guess work in cooking and enables one to obtain the same results at all times. It SAVES GAS, TIME, FOOD and WORRY!

We have it connected up with gas on our sample floor and shall be glad to have you and your clients call any time to witness a demonstration. An attractive booklet showing the entire line is yours for the asking.

BORDEN STOVE CO., 1311-1313 Arch St., Phila.

The Touraine Apts, 1520 Spruce street; the Daniel E. Hogan Operations at 54th and Wynnefield avenue, and 60th and Columbia avenue; the William Pilton Operation at 5959 Larchwood avenue; and the Presser Operation at Yeadon, Pa. are a few of the many operations which are enjoying the advantages of the DIRECT ACTION GAS RANGE.

As The Editor Sees It

THERE was a time about eighty years ago, when eggs in this country sold for six cents a dozen; when a chicken could be bought for eight cents, and when a gallon of whiskey could be purchased for thirty-two cents! Yet we should be very foolish even to wish to exchange those days for the times in which we are now living. Money was so tight that a great deal of buying was done simply by the exchange of one commodity for another.

Today we have the most wonderful opportunities; the most favorable conditions that have ever existed in this country. From every state in the union come reports of splendid financial and business conditions. Georgia, the state where fishing used to occupy almost as much time as business, has now forgotten how to fish and needs all its time to transact business. There, too, labor troubles are few, due to the very small proportion of foreign-born citizens. California, its bankers tell us, has never had such large bank and savings deposits as at present. Never has there been so much money in the country; never such industrial opportunities!

There is, however, a weevil eating at the heart of the prosperity which should and can be ours if we only use the opportunities before us. This is the weevil of under-production and inefficiency of labor. Of course, inflation, which The Federal Reserve Bank is now operating to decrease; profiteering; extravagance; all have their share in the high prices of today—but nothing can help to so great an extent, to bring prices down, as a great increase in production; and no class in America today controls the situation to any greater extent than Labor. Much is being done to open the eyes of laboring men to the folly of more strikes and more demands at this time, but the work is only begun and must be carried on more vigorously, as we can easily realize when we read in the *American Contractor* that—

Chicago Building Trades Labor is reported to be making the initial move for a wage scale which will call for $1.25 an hour in most of the trades. Nothing could be more unfortunate than an extravagant demand of this kind, backed up by organized labor at this time in the city of Chicago. The public should understand the significance of this move. It is a campaign of profiteering by labor and profiteering of the most vicious sort.

Last year, during the months most favorable to building activities, a strike and lockout brought about the complete suspension of building in Chicago. Like all other cities, on the signing of the armistice, Chicago had a determined housing problem and it has grown more serious each week from that day to this. The daily papers are full of complaints about high rents and profiteering landlords and the city council is doing all it can to force down rents. Its efforts are futile. The damage has been done. It was done last summer when, instead of working day and night in order to provide the housing facilities so badly needed, the building industry was idle because of the controversy between the employers and the employes.

This idleness made the housing shortage more acute. As the conditions now are Chicago must build houses and apartments this summer regardless of cost. The building trades labor unions realize this. They now come forward with the proposition of capitalizing this public necessity and forcing from the builder and the contractor a wage of $1.25 per hour, an extravagant demand in every sense of the word, and in addition to the demand as far as is now evident, there is no disposition to give any guarantee that the laborer who proposes to force $1.25 an hour will in any fashion give his maximum production during that hour. There is no guarantee that if the wage is granted further unreasonable demands will be absent during the rush season of this year.

There is a limit to all things and it seems the building trades labor of Chicago has reached that limit and the public interest demands that this form of profiteering be fought to the last ditch.

We are willing to admit there is an occasional contractor and an occasional

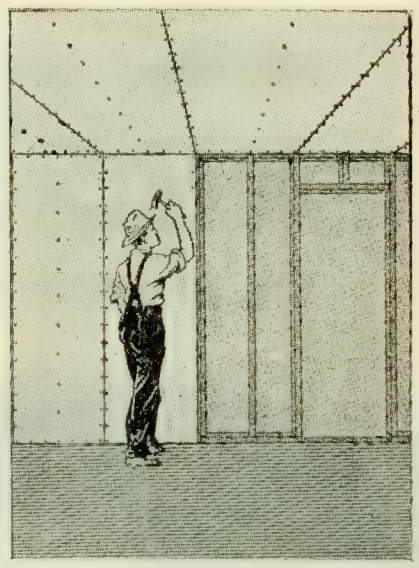
SHEETROCK
WALL BOARD

Sheetrock Saves Time—Labor—Material.

Plaster in wall board—that is **Sheetrock.** The pure gypsum rock center is the scratch coat of plaster, the mineralized paper coverings the finishing coat.



Sheetrock saves time for you, saves the long waiting for the ripening of plaster before it is ready to apply, and saves the long drying wait in all coats.

Sheetrock saves labor for **Sheetrock** is nailed on by your own men—in a jiffy. Saving labor today means real saving in time, money and anxiety.

Sheetrock saves material for **Sheetrock** is much cheaper in cost than plaster and labor.

You will find that **Sheetrock** gives permanent satisfaction. It will never warp, bulge or crack. And it takes any kind of decoration, so that a home can be made as artistic with **Sheetrock** as with plaster without the limitation of plaster.

Bond

All the requisites for the best belting will be found in ***Bond***—the belt for all difficult drives.

¶ Engines, belts and machinery are all necessary to production. Belts play a greater part than is often realized. Be sure you are getting the ultimate efficiency from your belt. The greatly increased use of ***Bond*** Leather Belts proves that their long life and merit are widely recognized in every industry.

We use the Best Packer Steer Hides, tanned by oak bark process, following the most skilled methods in order to add life and strength.

Write for our literature at once.

"Bond" belts pay the biggest dividends on power transmission investments.

Barrett Specification Roofs

Guaranteed for 20 years

The "Oil City of America" makes a Record—

TULSA, Oklahoma, sometimes called the "Oil City of America," is one of the fastest growing towns in the Middle South.

In the past three years the population of Tulsa has jumped from 28,240 to nearly 79,000!

More people mean more business, and more business means more buildings. That is why Tulsa is constantly building, building, building. The city's skyline changes every few months!

Tulsa insists that its new buildings be up to the minute—thoroughly modern in every respect. Thus it is that the buildings shown here, as well as most of the other prominent buildings in this live city, are covered with Barrett Specification Roofs.

Known Costs and Guaranteed Service

The Barrett Specification represents the modern way of buying a roof.

When you write the Barrett Specification into your building plans, you definitely eliminate all uncertainty connected with your roofing problems. You deal with *known costs* and *guaranteed service.*

For we are ready to *guarantee* Barrett Specification Roofs to give 20 *years of service,* free from maintenance costs of any kind.

This guaranty, which is in the form of a Surety Bond issued by the well-known U. S. Fidelity & Guaranty Company, of Baltimore, costs you absolutely nothing.

It is obtainable on all roofs of 50 squares or over, in towns of 25,000 or more, *and in smaller places where our Inspection Service is available.* Our only stipulation is that the Barrett Specification dated May 1, 1916, be strictly followed and that the roofing contractor shall be approved by us.

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

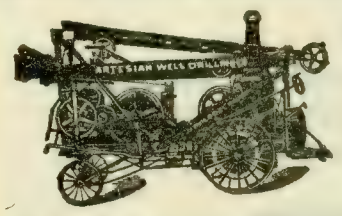
We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.



This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

Proposals

SEALED PROPOSALS.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., February 27, 1920.—Sealed Proposals will be received at this office until 3 P. M. March 26, 1920, and then opened, for changes in approaches and lobby vestibule doors at the U. S. Post Office and Court House, Harrisburg, Pa., in accordance with the specification and drawing Nos. 1D and 3D, copies of which may be had at this office or at the office of the custodian, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from Page 167.)

speculative builder who, in this time of serious distress, is out for all he can get and will take every advantage he can. These are profiteers and no condemnation of them is too severe. They are, however, the exception and when labor goes in for the policy of "getting while the getting is good" justifying this form of social and industrial blackmail by the careless assertion that the building interests are "getting theirs" they do not make a fair statement of the case but put up the exception as the rule.

It is not enough for the construction industry in Chicago to understand the iniquities of this latest move on the wage question by the organized labor forces. It has come to the place where action of this kind is menacing the health and material welfare of the entire city; it is very much a matter of public welfare and the public should be given the facts.

Contractors themselves sometimes contribute to just such conditions by granting any demands made upon them in order to finish a job. The *Record and Guide* (New York) gives a report on the speech of C. G. Norman of New York City, before the New York State Association of Builders in Syracuse. "Mr. Norman pointed out," says the *Record and Guide,* that a very large part of the labor unrest in the Metropolitan district was due to independent builders not affiliated with the organization and the speculators who were willing to pay almost any advance in order to get their structures completed and then pass on the additional cost to the purchaser of the building. He cited one enlightening example of a speculative builder who started his work paying bricklayers at the established rate of $8.50 per day. After the walls were up to the second story the bricklayers struck and demanded $9 a day, which they obtained. Somewhat later they again walked out with the demand for $10 a day, and the builder, in order to carry on his work, had to pay it. Just before this building was up to the roof tier the bricklayers again demanded an increase, this time for $12 a day, and it was necessary to pay this outrageous wage in order that the work might be finished and the owner save his equity in the project. This was not a hypothetical case but one which was confirmed by the viisting officials of the International union."

Such conditions are widespread over the country and are affecting all branches of industry. Every employer of labor *must* feel his responsibility in the matter. It rests on each individual employer to get into closer touch and harmony with his men; and through a closer relationship and sympathy with Labor, to instill into his men the right ideals of efficiency, production, thrift—whether personal or industrial, and a full realization of our obligations to our fellowmen; all of which can be summed up the in the word —Americanism.

Roosevelt has said:

"The wage worker should not only *receive* fair treatment, but should *give* fair treatment. In order that prosperity may be passed around, it necessary that the prosperity exist.

In order that labor shall receive its fair share in the division of reward, it is necessary that there be a reward to divide.

We must always keep in mind that to reduce the amount of production serves merely to reduce the amount that is to be divided.

No man and no group of men may so exercise their rights as to deprive the nation of the things which are *necessary* and *vital* to the *Common Life.*

Every encouragement should be given the business man, the employer, to make his business prosperous, and therefore to earn money for himself; and in like fashion every encouragement should be given the efficient worker."

"Preachers of violence are themselves the worst foes of the honest laboring man."

* * *

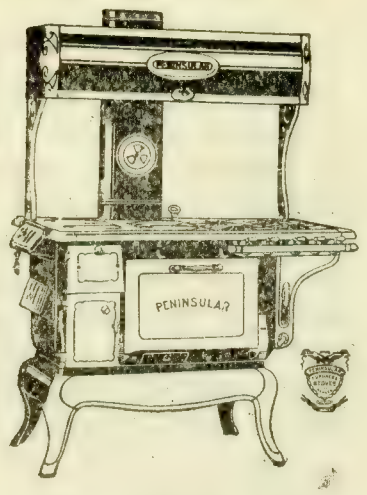
HOUSING PLANS IN PATERSON, N. J.

To spend approximately $1,500,000 in building homes in order to relieve congested conditions is the decision of the committee appointed by the Mayor of Paterson, N. J. Two hundred new homes will be erected and Paterson will become a municipal landlord as soon as work can be started. The houses will be of frame, say advices from that city, of the standard two-family type, with five rooms and bath on each floor and two rooms in the attic. They will be rented at a fair figure, the rental charge to apply on the purchase price. The houses will cost about $6,000 each.

VARIATIONS IN LUMBER MEASUREMENTS.

Of the lumber exported by a company in Northern Sweden, 69 per cent. is cut to English feet, according to Trade Commissioner Axel H. Oxholm, as quoted by the Daily Trade Reports of the Bureau of Foreign and Domestic Commerce; 7 per cent. is cut to Danish feet (1 Danish foot is .9711 English foot); 8 per cent. to "metric feet" (1 metric foot is 1.0936 English feet); 7 per cent. to Spanish feet (1 Spanish foot is 1.0783 English feet); 4 per cent. to Dutch foot is 1.0783 English feet); 4 per cent. to German feet (1 German foot is 1.0639 English feet) and 1 per cent. to decimeters (1 Decimeter is 3 15-16 English inches). A standard unit of measurement for the principal countries of the world would seem to be an urgent need if export trade is to expand as present conditions indicate.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.



People who want to buy things do not catch the seller, chloroform him and cram the orders into his pocket.

Advertising is the proper education of the public as to where the thing can be found, and therefore it is a necessity.

We are parts and particles of each other, but a little of the kindly glue of human brotherhood is needed to fasten us together. The policeman who keeps the crossing clear, and at the same time informs us as to the location of the post office and the First National Bank, no doubt is, in one sense, an economic waste. On the other hand, he is an economic necessity. He is a necessary middleman.

He relieves the congestion of traffic and granting the hypothesis that he does not misdirect us as to the location of the post office, he speeds us on our way.

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building magazine this side of Manhattan Island.

A Few of the Reasons

why you should install the **Peninsular Combination Range:**

A Range that burns either Gas, Coal or Wood without any changing or removing of parts—separate or both at the same time—whose oven is always ready for instant use.

A Range that takes up no more space than an ordinary kitchen range, bakes and broils perfectly under all conditions and gives a lifetime of such service.

A Range that makes the kitchen cool in Summer, warm in Winter—beautiful in design, substantial, and easy to keep clean. Secure our prices.

As The Editor Sees It

FIRE losses, ten times greater here than in any other country, have always been a great menace to American life and property. In the view of the great dearth of all kinds of buildings and the great cost of replacement, loss of buildings by fire is at present a greater calamity than ever before.

We have, on several occasions, commented in these columns on the campaign against fire losses being carried on by various agencies.

The Common Brick Manufacturers' Association has now enlisted its efforts in support of a great educational and fire-prevention campaign and hand in hand with this movement goes reforestration.

The Structural Service Bureau, "an organization for promoting the greater, safer and more efficient use of building materials, equipment and devices, through a better understanding of their nature, manufacture and utilization," comments on this move of the Brick Manufacturers' Association:

One of the most forward-looking steps ever taken toward the preservation of life, conservation of natural resources, and reduction in loss of property, due to fire, and in the interest of preserving to the world the created wealth due to the labors of man, was taken by the Common Brick Manufacturers' Association at its second annual convention recently held in Columbus.

An address was delivered by D. Knickerbacker Boyd, a Fellow and former Secretary of the American Institute of Architects and, during the war, chief of the Material Information Section of the U. S. Housing Corporation, in which he deplored the fact that the various building materials industries, with the single exception of Common Brick, have in the past been clamoring for the use of their materials almost irrespective of their durability, safety and appropriate use in construction.

He stated that the time was immediately at hand when some organization should take the lead in instituting on he part of the governmental authorities, technical and other associations, a national program of education, in all matters pertaining to sound construction and the elimination of this country's enormous fire losses which are pratically ten times greater than any other country in the world.

In response to his rousing appeal it was voted by the convention to call upon the national, state, and municipal institutions to co-operate with existing scientific, professional, technical and other organizations of the country as to furnishing authoritative informative data on the source, manufacture and intelligent use of all materials of construction.

It was also voted to request the national government to put into effective operation a comprehensive plan for the scientific cutting of lumber and reforestration. Also that advantage should be taken in the interest of safety to life and property from fire, and in the interest of health, conservation and durability with consequent saving of maintenance cost of the materials extracted from the earth and that they should be used for all walls and roofs of buildings to replace combustible materials and to save for the other diversified uses of man the wood which can not be replaced by other satisfactory materials.

Stress was laid upon the necessity of preserving, insofar as possible, the God-grown growth of standing timber to protect the watersheds of the country, to conserve the scenic effects and natural resources, and to reduce the cost of safeguarding America against fire.

It was voted that all fire walls and party walls separating buildings and enclosing exits for human beings should be of solid materials, and the Common Brick Manufacturers' Association offered its services and facilities to all government officials, associations and citizens individually and collectively in the furtherance of the far-reaching program outlined above.

The complete resolution as adopted is:

Whereas, The Common Brick Manufacturers' Association of America, in second annual convention, assembled this eighteenth day of February, 1920, at Co-

DRAWING MATERIALS

CHARLES H. ROBBINS, JR.

1209 Arch Street, Philadelphia
BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 614

BLUE PRINTS

lumbus, Ohio, has been enlightened and inspired by an address of inestimable value to its organization, its members and the future of the product which it champions, and

Whereas, we wish to make proper recognition of the benefits of said address, by the adoption of a resolution, complimentary to its author, Mr. D. Knickerbacker Boyd, now, therefore, be it

Resolved, that we hereby do so and also place our organization on record as firmly believing in the principles herein set forth:

First, that the building policy of the people of this country has heretofore been too largely left to individual initiative which, without authoritative data from any one centralized agency, governmental or otherwise, has been conducted along lines based on lack of adequate information as to the source, nature and appropriate use of materials.

Second, that the many buildings constructed of wood have been largely responsible for exhausting the supply of lumber and causing the destruction of forests and standing timber produced by long years of growth and development impossible of replacement without similar long years of growth, if replaced at all.

Third, that the destruction of much of such growths of timber seriously affects the watersheds of this country, results in an enormous economic loss through lack of fullest conservation of the country's natural resources, and impairs the landscape, scenic effects and privileges of the people.

Fourth, that all such timber as can, through scientific cutting and reforestation be spared, should be made available for such of the diversified uses of man than which no other more suitable or satisfactory material is obtainable.

Fifth, that the products of nature's growths of timber should not be used in vertical structural features of buildings or for their roof coverings, or else where that any unburnable material might be used and that, wherever used, wood shall be adequately fire stopped, Therefore, be it further

Resolved, by the Common Brick Manufacturers' Association of America that the national and state governments be requested to put into effect as speedily as possible, a comprehensive plan for a system, observable in every state, for the scientifiic cutting of timber and reforestation;

And, that the national government be also requested to avail itself of the cooperation of all scientific, professional and technical organizations versed in conservation measures, fire prevention and permanent building construction, to educate and inform the people as to the proper materials to use and methods to employ in the erection of all buildings for the sheltering of humanity, in order to accomplish the following purposes:

(a) To secure safety to life from destruction by fire.

(b) To assure health and comfort of the occupants of buildings.

(c) To make for durability and consequent decrease in maintainance costs.

(d) To lessen the loss of property and conserve the natural resources of the country.

And, that those materials extracted from the earth, whose supply is practically inexhaustible and the nature of which is indestructible when properly manufactured and used, should be taken advantage of to replace destructible or combustible materials, in the interest, not alone of safety, health and maintenance, but to preserve to the world the wealth created by the labors of man, and to decrease the cost of safeguarding America against fire.

And, that the Common Brick Manufacturers' Association call upon the producers of all non-combustible building materials to co-operate with the government and with each other in securing the most appropriate and permanent use of such materials in the various features of building construction, including by reason of demonstrated facts the use of solid walls as proper for fire walls, party walls or barriers against fire in buildings or for exits, and be it finally

Resolved, that the Common Brick Manufacturers' Association offer to the government, to all scientific, professional and technical organizations and to the citizens of the United States, individually and collectively, the services and best offices of its organization and its members in securing in the interests of humanity, the most advantageous use of non-combustible, permanent and economic materials, including solid common brick as a basic building material.

RESOLUTION AFFECTING MEMBERSHIP FEES IN A. A. E.

A plan for a real unified engineering organization for the United States is contained in an announcement made by the American Association of Engineers that one-half of the entrance fee of $10 will be waived to applicants who are members of recognized national and local engineering societies and clubs of the United States. This arrangement will be in effect only until the 6th annual convention to be held May 10, 11 and 12 in St. Louis, unless it is extended by the convention. The resolution is as follows:

"Inasmuch as the support in membership of every professional engineer in the United States is needed by the American Association of Engineers to accomplish professional unity, and inasmuch as many engineers have helped the profession by giving time and money for a number of years to that end through recognized societies and clubs:

"Be it Resolved, that until the 1920 convention (May 10-11), the membership committee be authorized to waive one-half of the entrance fee of $10 to applicants who are in good standing in such recognized clubs and societies and to accept such applications when accompanied by an entrance fee of $5.00."

The Executive Board of the National Association of Building Trades Employers held a meeting in Chicago recently and, if there has been the least doubt as to the part this organization is to play in the construction industry in 1920, it now has been dispelled. Mr. Andrew Lanquist, of Chicago, is president of the association, and Mr. F. G. Webber, of New York, is the executive secretary. Both are thoroughly familiar with all phases of the building industry and especially well qualified to deal with the labor problem which is the chief problem with which the association concerns itself.

The National Association of Building Trades Employers has been organized to handle the labor question in the construction industry. It is not committed to a labor policy other than the arbitration of disputes and the handling of controversies by peaceful methods. This is its task and it takes it up without prejudice or predetermined policy, except as stated.

During the last six months it has made a very encouraging progress in its organization work. In January its first annual convention was held in Indianapolis and the constitution and by-laws of the organization were revised and strengthened and financial support planned on a scale liberal enough to permit of making the organization a real factor in the construction industry. During the next few months the organization work will be speeded up and there is every reason to believe that the organization will prove one of the major factors in bringing about a stabilization of labor conditions and the establishment of a system of arbitration in the building trades.

In addition to Mr. Lanquist and Mr. Webber, the recent executive board meeting was attended by E. M. Craig, Chicago; P. M. Fogel, Kansas City; W. F. Hennessy, Cleveland; G. C. Mills, Webster City, Ia.; C. C. Pierson, Indianapolis; D. T. Riffle, Pittsburgh, and C. F. Waltz, of Cincinnati.

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

Stone and frame, 2 stories, 35x35 feet and 22x55 feet, shingle roof, North Carolina pine floors, stone foundations, hot air heating, electric lighting. Owner is taking subbids.

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

FINAL UNIFORM STANDARD SIZE FOR BRICK

At the second annual convention of the Common Brick Manufacturers' Association of America, held in Columbus recently, a paper was read by William Carver, assistant secretary of the Association, on "Why There Should Be a Standard Size for Common Brick." Among otner things, Mr. Carver said:

"Taking up in detail the advantages to the architect, the engineer, and the contractor in having a uniform, standard size, it is now recognized that in most localities, common brick are entirely suitable for facing purposes. In making working drawings for brick buildings, the architect finds it impossible to dimension such things as window and door openings and pier and pilaster sizes until he knows the size of the brick which will be supplied to the project. This means much lost time and motion, and if it is decided to change over to another brick, a great deal of money is lost in changing dimensions all over the drawings.

From my own experience, I can assure you that the architect will welcome heartily a standard size brick, so that no matter where the building is that he is designing, he can go right ahead with his working drawings.

The considerations which affect more particularly the engineer are also of great importance to the architect. The structural engineer is interested especially in the strength of a building and its parts. He must have defiinite formulas of strength of his materials. These formulas are derived from actual tests generally made by concerns specializing in such work, or by universities, etc. He can obtain formulas covering the strength of wood, steel or cement down to the last fraction of the pound. When he comes to brick, however, he is forced to do some guessing, owing to the variation in the sizes of the bricks which are tested.

When common brick is used to back up face brick, both the face brick and the common brick should be of the same size. The weakest part of a wall is the mortar joint and where the mortar joint has to be increased, the wall is weakened just that much. Where the face and backing are of different sizes, the courses must be evened up by increasing the mortar joint either on one side or the other.

A bricklayer cannot work fast when the bricks are of different sizes and any factor which tends to increase the cost should be eliminated as far as possible. In a recent letter one of the engineers of the Department of Public Works, Philadelphia, says:

"I am in receipt of your letter regarding standard size for brick. I have been wondering for a very long time why we had so many different sizes of brick throughout the country, and, in fact in local territories. It has seemed to me that every manufacturer has persisted in manufacturing his own size. In my opinion, there is no reason why we should not have uniform dimensions for brick, except possibly for fancy face brick used in building construction. I would certainly welcome in my work, a uniform dimension."

When a contractor is figuring a building, he should be able to know before hand just how many brick go into a wall. Upon this depends also the amount of bricklayers' time required to lay the brick, and the amount of material in the mortar.

There is, I believe, great value in having one standard for all bricks, whether face or common. During the war, the government showed us the great waste in having different standards for similar materials. One of the first steps it took to put industry on more efficient basis consisted in eliminating many standards which, up to that time, had been considered essential. And apart from the question of strict utility, there will be a great advantage in letting the building trades know that from now on every brick of every kind will be of the same uniform dimension.

When speaking of the standard size, I refer to the size 3¾x2¼x8. There are several reasons why, in our opinion, this size should be adopted by our own association. Figuring with a joint of ½" two headers plus a joint just equal the length of a stretcher. This makes it possible to use almost any bond or pattern desired on the face of the wall without difficulty.

The same consideration would also hold true regarding the thickness of the wall. With a wall 8" thick, there would be a vertical joint ½" thick between each 4" thickness of wall, and all building codes throughout the United States will be able to call for an 8 or 12 for 16-inch wall without fractions.

Another very important reason is that this size has already been adopted by the American Face Brick Association and the National Brick Manufacturers' Association. Comparisons were made on the relative amount of clay required for an over-

Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

sized and a standard brick, and the selling price of each. It seems to me that before we can have a uniform accounting system, of much value, every brick manufacturer must base his accounting on the same sized brick, or his figures will be misleading."

Letters were read by Mr. Carver from Prof. A. V. Bleininger and Warren E. Emily of the United States Bureau of Standards, expressing themselves favorably toward the adoption of a uniform standard size for brick.

After some discussion, on the part of manufacturers and the reading of extracts from various specifications, governmental and others by D. Knickerbacker Boyd, consulting architect of the association, showing the further necessity for a common standard, the size 2¼x3¾-x8" was unanimously adopted as the standard size brick of the Common Brick Manufacturers' Association of America.

Committee C-3 of the American Society for Testing Materials convened in Columbus the following day, and it was voted to put to letter ballot of the full committee the recommendation of those those members present that their tentative size be changed to meet the size adopted by the Common Brick Manufacturers' Association. Thus, the standard size of that Society, the American Face Brick Association, the Common Brick Manufacturers' Association of America, the National Brick Manufacturers' Association will be exactly the same, 2¼x3¾-x8", making this size the National Standard.

PROTECTION OF HISTORIC BUILDINGS

By Horace Wells Sellers.

Those who have read Baring Gould's sketches of "An Old English Home" may recall his chapter relating to the parish church in which he deplores the injury so many of the ancient buildings have suffered in the hands of the so-called "restorers." Many of these structures, he reminds us, were built of local materials, and decorated by the inhabitants of the parish, who left in their handicraft something of their very best, only to be replaced in modern times by stuff manufactured at a distance and too often chosen from an illustrated catalogue. "Some wiseacres," he adds, "cry out because antiquaries complain at this devastation, but have not these latter a right to complain when parochial history written into the parish church is being obliterated?"

It is reassuring to know that these sentiments became sufficiently widespread in England to crystallize into a permanent organization entitled the "Society for the Protection of Ancient Buildings," founded in 1877. In the current annual report of this Society its purpose is set forth in its plea to put Protection in place of Restoration, in dealing with ancient structures of historic and architectural interest, and, while staving off decay, to resist the temptation to tamper with either the fabric or its ornament; "in fine to treat our ancient buildings as monuments of a bygone art, created by bygone manners, that modern art cannot meddle with without destroying."

The report calls attention to the fact that each change made during the early history of these ancient structures reflects truthfully the fashion of the time, and that imitation or forgery was impossible in the era of medieval art, while today the civilized world, amidst its knowledge of the styles of the past, has no style of its own in the same sense that the architecture of the Middle Ages was alive with the spirit of the times in which it was fashioned.

While this is true of the more ancient monuments of the Old World, the same plea cannot apply without quailfication to the architecture of the latter times, and especially of the seventeenth and eighteenth centuries to which our early American buildings belong, and which we would see restored to their original condition. We are only too familiar with changes wrought in our early architecture during the nineteenth century, after the breaking away from the principles of design that governed the work of our master builders during the colonial period, and we have not, therefore, the same occasion to deplore the destruction of modern details where changes made in the nineteenth century are in the way of the restoration of an ancient building.

We can, however, join with our English kinsmen in the support of the general principles of preservation rather than attempted restoration where the craftsmanship of the Middle Ages is concerned, in the desire to safeguard what James Russell Lowell in writing of our relations to the mother country describes as "its heirlooms of immemorial culture, its historic monuments, ours no less than theirs."

The report before us contains photographs of interesting buildings, representing cases the Society has had to deal with as a general indication of the work accomplished during the preceding year. It points out that even where a structure has come into private hands, and it is threatened with changes to adapt it to the owner's needs, the Society has been successful in having the work done under the supervision of an experienced architect in sympathy with the Society's ideals.

Included in the report is a paper read by Prof. S. D. Ashead, F. R. I. B. A., dealing with "Old Villages and Village Reconstruction," in which is traced the growth of the early English communities. In presenting his plea for their protection he quotes William Morris, who, in addressing a group of young architects, said that "at one time any village could boast of a decent little chap who knew something of building, who could put up a decent little home for a decent little man to live in, but now it takes a highly skilled architect to draw up plans and arrange technicalities."

Professor Adshead, in considering the ancient villages of England, holds that "he who can carelessly destroy the works of those who have long since ceased to toil is surely lacking in a sense of reverence and respect," and while we on this side of the Atlantic may not go quite as far as this, especially when we view the towns that are the product of the period of our greatest industrial growth we can sympathize with the Professor's point of view in the face of the changes being wrought by foreign immigration in case of some of the ancient villages of New England."

We can agree with him also in his suggestion that instead of improving and enlarging the picturesque old villages by crowding in new structures among the old, the "policy should be to create new villages entirely separate, but close to the original settlement, just as Brighton and Hastings are not extensions or enlargements of the old fishing villages"

The activities of this English society in its special field are similar to those of our "Society for the Preservation of New England Antiquities," and, in this age of shifting change in our older communities, there is increasing need of agencies to safeguard the landmarks in the keeping of this generation and which should be the heritage of those who come after us.—*Journal of American Institute of Architects.*

As The Editor Sees It

We are in receipt of the following communication from Major E. E. Hollenback, President of the Philadelphia Master Builders' Exchange. In a spirit of co-operation we gladly reproduce the notice. Hereafter all notices of meetings of the Exchange, or of its committees, conferences of all kinds, comments, suggestions, criticisms or whatever may be of interest to the members of the Master Builders' Exchange will be found in the BUILDERS' GUIDE. It is our desire to help stimulate interest in the Exchange, to promote closer contact between the members, to further the work of the Exchange by developing a spirit of co-operation among the building trades.

In these days, when so much depends on how soon we can get deliveries in all materials and how fast we can complete jobs, why not get together and help each other overcome difficulties? What better time to talk over these matters than at lunch on Thursadys? Support Major Hollenback and his administration. If you have anything to suggest, any criticisms to offer, let's have them; we'll publish.

President Hollenback's letter:—

THURSDAY, MARCH 18th. 12.30 until 1.30 P. M.

LUNCHEON OF THE MASTER BUILDERS' EXCHANGE will be held at the BELLEVUE-STRATFORD CLOVER ROOM.

The speaker will be Major General William G. Price, Jr., a strong, convincing talker. General Price has a most interesting message for men.

You must lunch. Why not with us?

A fine lunch; one speaker, and it all takes place in exactly *one hour.*

Meet your friends at the luncheon and bring a guest, particularly a man connected with the building industry.

Single tickets may be purchased at the dining hall or at the Builders' Exchange, for the balance of the March luncheons.

The April luncheons will be very interesting, indeed. Look over the following speakers:—

March 25—Thomas Shallcross, Real Estate Board.

April 1—William D. MacAvoy, the newly-appointed U. S. District Attorney.

April 8—David Knickerbacker Boyd, the well-known architect.

April 15—Someone you will be glad to hear.

The luncheons are just one of the many things planned by the Exchange this year. Keep step with us. We are going ahead. You will need us and we will need you.

Constructive criticism is helpful. We welcome it.

Camilus Phillips, secretary and superintendent, and Charles H. Trommer, assistant secretary, are no longer connected with the Exchange. E. J. Woods has been appointed secretary.

The office of the Exchange is being reorganized to meet the increasing business, and to help every man in the building industry.

Two private branch telephone exchanges are being installed and an operator will be ready to take your calls or messages.

For any information call Bell, Market 2806 or 3582; Keystone, Main 2932 or 2933.

Each member owns part of the building; each is a master in his line; without one, the building could not be erected; hence the name, MASTER BUILDERS' EXCHANGE.

For prompt attention all communications should be addressed to the MASTER BUILDERS' EXCHANGE, 18 S. 7th St.

We will look for you at the Thursday luncheon. Come out and join the good fellows. Don't miss a good talk and a good lunch.

* * *

ON repeated occasions, Honorable J. Hampton Moore, Mayor of Philadelphia, has requested suggestions for betterment of the city. A Delaware River Bridge from Philadelphia to Camden is now strongly advocated. Accordingly, elsewhere in this issue, appears a plan prepared by E. Simpson Lemmon, for the last thirty years a practicing architect and engineer in New York, Philadelphia, Washington and other cities. Mr. Lemmon's plan and accompanying description emphasizes ad-

vantages in utilizing districts not at present congested.

* * *

THERE is food for thought in the recent letter from Mr. John Ihlder, Secretary of the Philadelphia Housing Association, to the President of the Philadelphia Real Estate Board. In our efforts to meet the great and daily increasing demand for buildings in this city, it is very easy to look only to satisfying the present needs of the community and overlook the objectionable developments which may result from lack of comprehensive consideration.

"At recent meetings," says Mr. Ihlder, "where the zoning ordinance has been discussed by real estate men, it was evident that the objectors were thinking chiefly of individual pieces of property, not of a large district, or of the city as a whole. At one meeting the real estate men were referred to as gamblers who are constantly taking a chance. One dealer declared that all restrictions are objectionable. Apparently he wishes to figure on the utmost price that may be derived from a given property in the immediate future and is comparatively uninterested in what may happen to it later, or what the effect of his proposed exploitation may be on neighboring properties or on the city as a whole. One of the leading operative builders has several times publicly stated that they are gamblers. . . .

"The Housing Association, which has to deal with the results of the gambles, believes, as a result of its experience, that it would be to the interest of all concerned—in the long run—if the element of gamble were reduced and the physical development of the city put upon a sound business basis. . . .

"We, therefore, hope that your committee, in studying the ordinance, will figure not on the basis of the immediate utmost development of an individual property, but on the basis of the permanent economic development of groups of properties, taking a square as the smallest unit in their calculations, and considering the square as an integral part of a district or neighborhood and the district or neighborhood as an intelgral part of the city. . . .

"We hope that your committee will project the development of an entire square on which there now stands one of our highest building and show:

First. The result if all the properties are covered to a similar height without any of the land being reserved for light and air-spaces.

Second. The result if all the properties are developed to a similar height, reserving 10 per cent. of unoccupied area.

It would be of practical value to the city to learn, after thorough studies as above outlined, if your committee believes it will be more profitable, as a continuing investment, not as a building proposition in which the uncertainties of the future are passed on to new owners, to

(*a*) Develop a whole square to the height of the highest building—say 300 feet—without reserving at least 10 per cent. for light and air.

(*b*) Develop a whole square to the suggested height of 150 feet with addition height permitted for setbacks, without reserving at least 10 per cent. for light and air.

(*c*) Develop a whole square to the suggested height of 150 feet, with setbacks reserving more than 10 per cent. for light and air.

That is, at what point in density of building will diminishing returns per square foot from office rental begin to overbalance the increased floor area? . . . .

"In this connection we hope that your committee will express an opinion on the effect of one very high office building, which meets all the contemporary demand for office space, in delaying the improvement of other properties now occupied by antiquated buildings. It is better to have an occasional skyscraper surrounded by antiquated buildings or to have a large number of lower office buildings? . . . .

"So far we have spoken only of effects within the building lines of squares or blocks. We hope that your committee will also consider the effect of building beyond the maximum heights suggested in the ordinance, upon street frontages and upon the streets themselves. If Walnut, Chestnut, 13th, 15th and neighboring streets were lined with 300-foot buildings, what would be the effect?

First. Upon the lighting of front offices on the lower floors.

Second. Upon traffic in the streets? The population of such buildings would be enormous.

Third. Upon the transit facilities?

Fourth. Upon sewers, water mains and other public services? . . . .

"Would such a dense population facilitate or hamper business? What would it cost the city to enlarge its public services? Could the city even handle adequately the task imposed? For example, could it in addition to laying sewers and mains, widen the streets? If so, what method of general street widening would your committee suggest? . . . .

"Our belief is that the best economic development from the investor's or long time point of view as opposed to a speculator's or short time point of view, will be the kind of development that will promote the social well-being of the people. We are, therefore, looking forward with great interest to the report of your committee."

* * *

RESOLUTIONS

Adopted by Joint Conference of the American Institute of Architects, the Engineering Council, and the Associated General Contractors at Chicago.

1. That any system of duplication of effort in estimating, wherein each bidder separately estimates the quantities should be condemned.

2. That all competitive bids should be based upon a detailed schedule of quantities prepared from a survey of the plans and specifications and submitted therewith, the cost of preparation of such survey of quantities should be born by the owner.

3. That while the owner should furnish a quantity survey as the basis of bids and contracts, and should submit them with the plans and specifications, and should pay for same, the bidders should make no charge to the owner for submitting the proposals based on said plans, specifications, and quantity survey.

4. That in general competitive bids should not be invited nor submitted on projects, the plans and specifications for which are not accompanied by a quantity survey, unless the owner agrees to pay a predetermined fee to each bidder for preparing the quantities and submitting an estimate.

5. This conference proposes to prepare and present at a later date an outline of recommended practice in conformity with the above resolution.

BUILDING WITH CLAY HOLLOW TILE.

By Warfield Webb.

Within the past few years there has been a noted increase in the use of clay hollow tile in construction work. This is awakening in the minds of a large number of builders and architects the merit that such material contains for all kinds of building. Aside from the important feature of fire resistance, clay hollow buildnig tile has other advantages that are vital. It is not essential to use skeleton steel construction in the erection of high building with clay hollow tile. Reinforced concrete columns and girders make the larger use of this material unneessary, and at the same time give the desired strength to the structure. Both architects and contractors, who are giving the matter any study see the advantages of this combination of material for structural purposes where

SHEET ROCK

WALL BOARD

SHEETS OF REAL ROCK

For Beautiful and Lasting Interiors

SHEETROCK is a large, sturdy sheet or board of pure gypsum rock, gypsum being universally recognized as the most efficient material for permanent, substantial walls and ceilings.

SHEETROCK is manufactured by moulding and compressing pure gypsum rock, in plastic form, between two layers of tough paper specially made by us, and alum-sized to minimize the cost of decoration. After moulding, the gypsum recrystallizes—returns to rock.

SHEETROCK is furnished in large convenient sizes. A few boards will complete the average room. The boards are nailed to the studs, joists or other supports; or directly over old walls, brick or concrete surfaces.

SHEETROCK takes any form of decoration. It may be left in its natural silver-gray finish, painted or wallpapered. Joint tape, muslin or lining paper can be used before decorating. Any decoration can be paneled if desired.

SHEETROCK walls are permanent—they will not warp, buckle, shrink nor burn. The **SHEETROCK** Trade Mark on the back of each Board is your guarantee.

Advantages Over Other Boards

Insures against fire and climatic conditions.

Won't Burn, Warp, Buckle, Swell Nor Shrink

Is stronger and more rigid.

Is quickly and easily applied.

Can be painted beautifully.

Can be wallpapered with greatest satisfaction.

Adapts itself ideally to panel treatment.

Can be finished in flat surface by use of Joint Tape.

Saves fuel—more heat and cold-proof.

Resists sound—makes more quiet interiors.

Is vermin-proof and sanitary.

Costs no more than other wall boards.

Is economical and permanent.

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

CAMDEN-PHILADELPHIA BRIDGE, LOCATION AND APPROACHES

Proposed by E. SIMPSON LEMMON, Engineer

Copyrighted Plate, used by Permission of G. Wm. Baist, Surveyor, Philadelphia

In all public improvements the best results can be obtained by making as little change as possible in existing conditions where good, and changing freely where there is room for betterment.

In considering the proposed bridge over the Delaware River from Philadelphia to Camden, it would be unwise to add a large volume of traffic to an already congested district while adjacent territory is just rife for new conditions and new enterprises.

The Bridge is not a purely local matter and of course will become a direct highway between localities far from both cities and must include a direct route through the un-congested parts of each as a matter of national importance.

Consequently the main span has been located in a position to allow a straight line over it to continue to existing main arteries of travel outside the congested zones.

This straight line starting near the State Street Bridge over Cooper's Creek crosses the northwest corner of Camden, crosses the River at its narrowest point, and, by gradual descent, reaches present street grade at Ninth and Buttonwood Streets in Philadelphia; but this main approach is continued to Twelfth and Spring Garden Streets and will receive traffic from the North and West as well as from the Central district.

Traffic coming from York Road, Bethlehem, Allentown district reaches the Bridge at Tenth Street. The vast traffic from the Schuylkill Valley would come via Ridge Avenue and Broad Street for heavy travel, and light travel via Parkway and Spring Garden Street.

The western side of travel would come via Spring Garden Street and travellers from Baltimore, Washington and the South could reach the Bridge via Broad Street to Spring Garden Street.

On the North the Bridge spur would reach grade near Fairmount Avenue between Second and Third Streets, giving access to Kensington, Frankford and the Northeast.

The main spur to the South comes to Market Street in the middle of the block betweein Second and Third Streets, giving easy access for the present business centers and market districts.

The Camden end would have a spur

ending near Court House Plaza, with outlets to Haddon Avenue and to Broadway.

There has been no attempt in this plan to determine size or capacity of the Bridge. The province of this drawing and article being to indicate a suitable location and show a few fundamental facts as the reasons for such location.

The suspension type has been accepted as the proper method and it has been assumed that the Federal Authorities will require sufficient clearance for navigation. The Suspension Piers are located at the authorized Pier Head Lines. The anchorage Piers set well back allow a clear space below that would require no change in present conditions.

From Anchorage Piers, skeleton construction could carry the Bridge over buildings and streets for considerable distances and the sides of the Bridge could be lined with business buildings for several squares from each approach, thus immediately increasing values instead of destroying adjoining properties.

Should it be found desirable to include Public Transportation lines to a great extent, the steam railway lines could enter as shown by dash lines at Ninth and Buttonwood Streets. The Subway and Front Street Elevated have access via circular grade near the anchorage pier, while surface trolley lines have access at Market Street, at Fairmount Avenue, at Ninth, Tenth, Eleventh, Twelfth and Spring Garden Streets.

The grades are all easy, being from 2 per cent. to 4 per cent. at heaviest grades, and no necessity to change present grades of any streets, except possibly a slight change of Church Street and Buttonwood Street.

The traffic at both ends is distributed before leaving the Bridge in such a way as to prevent congestion at any oine point of delivery and avoids the possible repetion of the famous Brooklyn Bridge Crush.

A conflagration in the vicinity of any one of the approaches would not tie up all traffic over the Bridge as would be the case if only one entrance were provided.

The keynote is—Omit elaborate ornate and useless designs and concentrate on utility and real service.

Make Philadelphia-Camden the centre of intense practical activity.

* * *

(Continued from Page 208.)

heavy duty construction is demanded. This is only another factor that makes for greater use of this material, and it has been found upon comparison that there is often real economy in the use of hollow clay tile for all kinds of structural purposes.

If a strictly fireproof building is desired the walls are builded with hollow tile supported on columns and girders constructed with concrete, reinforced with steel bars. In such a structure it is not essential to use any other form of structural material. It is even possible to use a combination of concrete and tile for lintels of short span, though preference is usually given to concrete for this purpose. The foundation is of concrete, and the roof and floors can be constructed with concrete joists and tile fillers, thus making a building entirely of materials that will withstand the ravages of fire.

For the exterior coating of the walls, cement stucco is nearly always used, making the walls pleasing as well as durable. There is no limit to the decorative possibilities of stucco when used on hollow tile walls, and this adds another reason why the use of tile is desirable.

However, it is not necessary to cover the tile with stucco because there can be placed on the building a veneered wall of brick or stone of any kind, and in this way it is clearly to be seen how the wall can be treated in various ways. If there is no need for the elimination of the extra cost, then there can be the most elaborate plans worked out for decorative purposes.

Clay hollow tile makes both the matter of durability and cost less a problem. The question of its architectural possibilities is not limited to any particular style and it is possible to construct a very cheap building with this material, or on the other hand a most elaborate and costly one. It being a fireproof commodity in the first place, and the fact that it possesses dead air spaces, adding warmth in winter and coolness in summer, are factors that enhance its popularity.

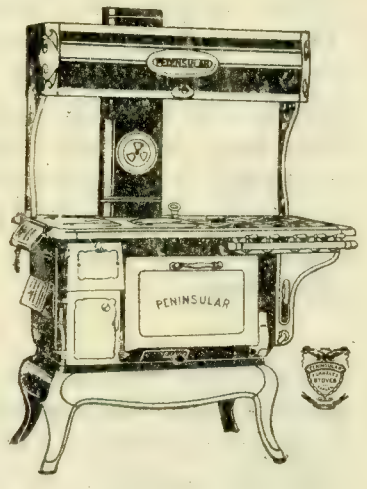
The architects and contractors cannot too frequently or deeply impress upon the public mind that, for the man who wishes to erect a modern home, for the man who wishes to build a mansion, or for the man who desires to construct a skyscraper, there is in hollow tile an excellent structural material for buildings in which the matter of fire resistance must be considered, together with cost and durability.—*National Builder.*

* * *

Fifty years ago the grocer set out a keg of mackerel and a box of kindling wood, and sat down to wait for customers. Today he carries street-car and newspaper advertising and dresses his windows as smartly as the department store. If it didn't pay he'd still be sitting behind the stove waiting for customers with a mackerel keg out front doing service for a sign.

Man and the giraffe are the only two living things that can't swim naturally. Throw a day-old kitten into the Mississippi and it will paddle its way to shore. The giraffe can't swim because he's not built that way. Man can't swim, just because he is afraid. The chances are that the reason you are not in the swim—financially or otherwise—is because you are afraid.—Glen Buck.

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.—John D. Rockefeller.



To be poor in a wealthy country, to be sick in a good climate, to be inefficient among a progressive people, is a sign of unwise educational methods. Such people were not taught to battle with the world or meet life's emergencies.—Thoreau.

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad. and kill every possible chance for display. An ad. should stand out. It should be easily read. It should draw the attention of the reader. A carload of detail can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its host of darkness; one set of men conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public besides—and themselves.

The valuable man in any business is the man who can and will co-operate with other men. The foreman who opposes the introduction of a new man into an institution and fights every innovation which he himself does not suggest, is doomed to a gradual and creeping defeat. Men succeed only as they utilize the services and ideas of other men. Co-operate!

When you stop to consider that the Guide reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class Every copy reaches a live prospect.

A Few of the Reasons

why you should install the **Peninsular Combination Range:**

A Range that burns either Gas, Coal or Wood without any changing or removing of parts—separate or both at the same time—whose oven is always ready for instant use.

A Range that takes up no more space than an ordinary kitchen range, bakes and broils perfectly under all conditions and gives a lifetime of such service.

A Range that makes the kitchen cool in Summer, warm in Winter—beautiful in design, substantial, and easy to keep clean. Secure our prices.

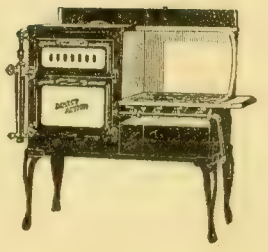
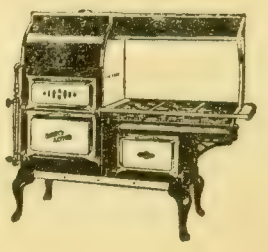
One of the many "reasons why" so many homes in and near Philadelphia are being equipped with the

Direct Action Gas Range





is that its patented oven heat regulator eliminates all guess work in cooking and enables one to obtain the same results at all times. It SAVES GAS, TIME, FOOD and WORRY!

We have it connected up with gas on our sample floor and shall be glad to have you and your clients call any time to witness a demonstration. An attractive booklet showing the entire line is yours for the asking.

As The Editor Sees It

EVERYONE is thrilled today at the mere thought of the wages which labor is demanding and receiving. We all agree that before wages come down high costs must be reduced and the final answer is production.

There is no doubt that labor can, in a very great measure, control this phase of the situation, and should be made to feel its large responsibility. It is certain, however, that the problem cannot be solved without co-operation of both labor and capital; of both employe and employer. Progress is being made daily toward greater harmony between employer and employee, but satisfactory results can not be attained without greater striving on the part of every employer of labor. In a recent interview Samuel Gompers has given some illuminating glimpses of what he would do, were he an employer.

"I should expect," says Mr. Gompers, "to share with my workers the increased benefit of large production, letting them know fully by arrangement with their committees just what it was we were sharing and why we were sharing it. The rates thus arranged would put a real premium on honest, active work and remove every possible difficulty in the way of higher and ever higher production. The idea of limiting production is a very prenicious one, but production will be limited until the two parties to higher production learn to co-operate."

* * *

NO industry is more vitally affected at present by high wages and high prices than the Construction Industry. Everywhere there is work to be done and everywhere people are waiting, if possible, in the hope of some recession in price. Such waiting, however, is foolish and useless, according to Perley F. Ayer, Chief Planner for the Aberthaw Construction Company. "Unless," continues Mr. Ayer, in the *American Contractor,* owners are prepared to put their plans in their pockets, to be kept there, not for two months, but for two years. In short, 1920 promises to be, both relatively and absolutely, the greatest building period that the United States has ever known.

We are, apparently, on the verge of a construction demand 40 per cent. in excess of anything previously encountered.

Whether or not this volume of construction will be accomplished is a question the answer to which is to be found not at all in pressure of demand, but exclusively in means of supply. Here exists a serious problem. During 1919, the shortage of materials and the uncertainty of their delivery, the insufficiency of labor, and the disorganization of transportation constituted the most serious impediments to the fulfilment of contracts with reasonable limits of time and price.

There is no sufficient reason to anticipate improvement in any of these particulars during 1920. A good many organizations, already creaking under existing strains, are likely to crack under the added burdens whcih will begin to blossom with the spring, and will grow and ripen with the expanding year. Not all projects launched will be brought to a triumphant conclusion.

In so far as these notes constitute a warning, however, they are not to be interpreted as a warning against undertaking building in general, but only against attempting certain kinds of it. The big, uncomplicated, industrial operations will be carried through close to schedule wherever they are entrusted to organizations with the capital, the mechanical apparatus, and the human organization capable of large scale procedure. Indeed, if the number of units to be constructed could be materially reduced in number and proportionately increased in size, it is a fair assumption that an expansion of 41 per cent. in volume could be met.

The work that will lag is small scale construction which requires special materials in unusual sizes, instead of standardized design throughout; and which, further, because of the necessity for meeting various architectural requirements, calls for unusually skilled and

BLUE PRINTS

conscientious workmanship at all points.

Curiously enough, therefore, the owner contemplating a big project should be encouraged to go ahead with it; the one with a small one should be counselled to a caution and to delay unless he knows himself, for individual reasons, to be in complete control of all the elements essential to a successful outcome.

* * *

Favor for a National Department of Public Works has been manifested by Congressmen who have sat in hearing on the Jones-Reavis Bill, according to M. O. Leighton, chairman of the National Public Works Department Association. Mr. Leighton states:

"It is doubtful if any proposal has been made in Congress in recent years which has met with so little opposition. The opportunities for success are almost unexampled in our legislative history. If there is failure, it will be by reason of the lack of aggressive action by the very men who are, by training and experience, qualified to appreciate most clearly the abuses of the present and the needs of the future."

* * *

HOUSING PLANS IN TOLEDO, OHIO.

A new million-dollar corporation began business in Toledo in January with the announced purpose of financing builders of homes, financing the man buying a home, financing the investor building large apartments for rent, financing owners of downtown real estate who wish to build or remodel, financing home owners who wish to modernize their homes or convert them into duplexes, financing manufacturers who wish to enlarge their plants. The corporation is strongly officered and managed, a majority of the directors also being officially connected with several of the leading banks of the city.

* * *

FINISHING ATTIC ROOMS TO TO RELIEVE HOUSING CONGESTION.

Housing congestion is so acute that the finishing of attic rooms is receiving attention by Chicago building authorities, especially by Building Commissioner Bostrom. It is estimated that there are in Chicago about 180,000 attic rooms which can be finished and made liveable, accommodating 200,000 lodgers. If these rooms are finished and made attractive at an average cost of $600 each and rented for an average of $10 per month, the gross return would represent 20% on the investment, the total investment being $108,000,000.

While housing laws do not permit the cooking or living quarters in the third story of frame buildings, in which most of these rooms would exist, they might permit of sleeping quarters and the rental would be very modest. The rooms could be properly finished so that they may not be too hot in summer or too cold in winter and halfway measures in remodelling them will not be profitable in the long run. If adequately done, they will assist the permanent resident in meeting higher rent problems and will help relieve the present congestion. The question of finishing attic rooms may be profitably considered by other cities.

BUILDERS' EXCHANGE ACTIVITIES

The Fourth Luncheon of the MASTER BUILDER'S EXCHANGE will be held at the Clover Room, Bellevue-Stratford, Thursday, March 25th, at 12.30. Prior to the luncheon, the Membership Committee will hold a meeting in the same room at 12 M.

Those who failed to lunch with the Exchange members last Thursday missed a most inspiring address. Fletcher Stites, a prominent Philadelphia lawyer, was substituted at the last minute to speak in place of Major General Price. General Price was to give the members some vital message for men. Certainly no one will doubt that Mr. Stites gave a message to the members that was as good as has been heard for years, if not as good as we ever had.

Mr. Stites astounded his audience by his marvelous memory in quoting at great length from masterpieces of English literature and from the world's history. The idealism and Americanism conceived by Mr. Stites, and made practical by his very clear explanation, were most exalted. Tracing back through the various periods of time his philosophy, Mr. Stites made manifest that real idealism and genuine Americanism had their inception at the time of Christ, when the Divine Master promulgated His doctrines.

Mr. Thomas Armstrong is to be congratulated on the selection of Mr. Stites as a substitute and, from the opinion voiced by the members present, Mr. Stites will be most welcome as a regular speaker.

Mr. Armstrong, in his convivial manner, told a few experiences of his recent trip to the coast and added a story appropriate at this season. Mr. Armstrong's suggestion to the members that they introduce themselves to each other and get better acquainted is most fitting. Why sit around like a bump on a log waiting to be formally presented to your neighbor at the luncheon table? Get acquainted. Introduce yourself. No one will harm you if you accost a stranger and tell who you are and ask the other fellow his name. It would not be amiss to put a small card in the buttonhole of our coats displaying our names, so any embarrassment that might exist because of not knowing every one might be removed.

This Thursday, Mr. Thomas Shallcross, former president of the Philadelphia Real Estate Board and ex-president of the Kiwannis Club, will speak at the luncheon. Mr. Shallcross has an interesting address, we are sure, as his style is always quite free and his arguments are always forceful.

Come out and hear some good speeches. An hour once a week with the members of the Builders' Exchange will give you a new lease on life.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

A certain wallboard man advertised in the Guide for awhile and then dropped out. We've had a dozen inquiries since then, asking for his address—every inquiry from a cash buyer. This is a common occurrence. It's hard to make some advertisers see the vital importance of a standing "ad."

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

SHEETROCK

The Contractor's Choice

FOR years you have been looking for this standard wall in unit form. You have wanted a unit material rigid, uniform and fire-resistive.

Here it is—Sheetrock.

A sheet of pure gypsum rock, Sheetrock won't warp, shrink or buckle. Sheetrock will not burn.

On all framework and in all moderate-priced construction, Sheetrock makes a job you can be proud of. It pleases the owner.

You can go over the work with him—point out how evently the units of Sheetrock join in a flat surface—remind him it will not crack or warp or buckle or shrink—remind him it will resist fire—because it is a sheet of gypsum rock—Sheetrock

And the longer he lives with it, the more that customer is going to value Sheetrock and respect your good judgement in using durable, good-looking, economical Sheetrock. Whenever he has any other building to do, he will naturally think of you first.

Look for chances to use Sheetrock on alteration and repair work. Sheetrock comes in broad, flat compact sections, 32 and 48 inch widths—ceiling high. It cuts, saws and nails like soft pine.

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

Stable (fire repairs), 1104 Parrish street,

Announcing--

a new era in fire protection equipment

NU-EX FIRE KILLER

THE ONLY FIRE EXTINGUISHER THAT WILL *ALWAYS* WORK

Your fire equipment is one of those things about which you should be in a position to positively know, not hope or guess. It's job, like that of a sentinel in time of war, may not amount to a great deal until emergency comes. Then its reliability is instantly of life and death importance.

The NU-EX FIRE KILLER introduces that kind of reliability in the field of fire protection equipment. It is the only extinguisher about which you can be instantly sure that it is ready for action; know that it will work unerringly. The features which make it so are exclusive to NU-EX. It is the only extinguisher which can have them.

Radically different in construction and operation from any other. So simple that it cannot go wrong and a twitch of your thumb and finger will set it at work. Cost is no more than the ordinary kind.

An investigation is a duty to yourself and yours. It will prove to you how and why NU-EX is ***sure*** protection.

THE BRICKLAYERS' PARTY.

There was an unusual party held in Philadelphia recently. Pennsylvania Local No. 1 of the Bricklayers' Union asked several architects, Messrs. Abel, Boyd, Bright, Medary, Sellers, and Zantzinger to meet with them and talk bricklaying. I never had less hesitation in accepting an invitation. In the midst of a snowstorm so furious that all street traffic was at a standstill, Zantzinger and I zigzagged on foot ten long city blocks, almost blinded by the stinging ice pellets, before we arrived at our destination. I think that we all felt—I know I did—an immense sense of virtue in having kept our engagement in spite of the frightful weather. But our hosts didn't seem to take this point of view at all. One of them remarked casually that it was a pretty rough night, and then the meeting was declared open.

These men wanted us to teach them how to read plans; they wanted to know what the different symbols meant with which we adorn our blueprints; how to lay out the work and construct a window-opening from the drawings. I had never given very much thought to the matter, but I was astonished to learn from the men themselves that not one of them ever had anything but a faint idea as to what the architect was driving at.

In Philadelphia, the general contractor is the carpenter and his foreman is in charge of the work. The master bricklayer accepts this situation as quite normal, and the bricklavers are discouraged from meddling with things which do not concern them. Anyone who has ever been closely in touch with the actual processes of building knows how effectual are the methods of discouragement employed by wrkmen or those over them. These men facing us, none of them very young, some of them well along in life, were totally ignorant of their art. They asked us to teach them what we knew. They spoke of the interest they would like to take in their work, of the imbecility of a system which demands that a certain number of bricks be laid up each day irrespective of quality of workmanship. Their mortar is prepared for them, they have nothing to say about it, and ofttimes, in order that the contractor may "skin" the job, it is delivered to them in such a condition that good work is out of the question. Throughout the evening there was not one word said, there was not one question asked except in the line of making the job better. Over and over again they asked, "Can't you architects fix it up for us so that we can have a little more interest in our work?". Their complaints about the way their apprentices are used by the master bricklayers and all their other griefs were of lesser consequence than the deep resentment they all felt against the system which stultifies every effort toward self-expression in their art. "We want to make the picture" was the expression used. "You tell us what you want and we'll make it."

It is true that they were talking in term of the ideal. In practice some of it might not work out, but was it not worth while to fight one's way through a terrific snowstorm to spend the evening with men who talked in the purest and noblest language of artists? "What can we do, and what can you do to help us produce better buildings?"

This request could not go unanswered and it was arranged that Mr. Abel should conduct a weekly class on plan reading at the Union Headquarters. It cannot be foreseen just what this will lead to, but knowing the spirit which animates the teacher and the pupils, something really worth while should be achieved.

With all due allowance for the difference between aspiration and realization, we came away from that meeting feeling that we had learned far more than we had taught. Our feeling was that it would be a crime to allow this great moral force to remain unutilized. Must we ignore it and continue all our bargaining on the brutal basis of the number of bricks laid regardless of the quality of the product?

The problem is to give these men an interest in their work. That is what they ask for and with some imagination, good-will, and mutual forbearance, it can be realized! Let them feel that they are at least to some extent artists, that hey are creators and not mere machines, and some of the evils connected with wages will perhaps be less difficult of solution.

JOHN IRWIN BRIGHT.

A KNOWLEDGE OF WOODS.

A knowledge of woods and their peculiar suitability for special purposes is not only a valuable possession for the builder, but is a source of never-failing interest as well.

The sources of information are numerous. The monographs of the Forest Laboratory are particularly rich in technical information, and the various lumber associations furnish gratuitously comprehensive descriptive literature on the qualities and uses as well as the best methods of treating their particular specialties.

Wise builders should possess the aids, study them and keep them on their reference files. These are the days for the studious, reading, builder to make himself a name.

To no other material is given the wide range of qualities found in wood; it is strong and comparatively light; is easily framed, and a good non-conductor of heat. For decorative purposes it furnishes a wide variety of color and grain effects; its natural grain forms designs which are always harmonious but never set, and its possibilities for varied treatment are unlimited.

The wide variation and physical qualities of the different species gives us a wood for every use. A weight of three hundred pounds will imbed a one-half inlh ball half its diameter in some woods, while for some others more than a ton and a half would be required. Woods that will withstand a direct pull of two and one-half tons per square inch are common, while some will run as high as thirteen thousand pounds or more. Four wood columns, twelve inches square and fifteen feet long, will carry a load of half a million pounds. Three men can easily carry a 16 in. x 16 in. column, ten feet long, and this column would readily support the weight of a modern freight locomotive. Woods are found weighing as low as twenty pounds per cubic foot, while others run as high as sixty.

Wood is also one of the best non-conducting materials used in a structural capacity. Its cellular and fibrous structure form a barrier to the passage of heat, which is not found in heavier and more dense materials. This characteristic saves it from condensing moisture and "dampness." It is not offensive to the touch in hot or cold weather, and hence its wide use in making furniture and as a flooring material. Its resistance to the action of weak acids and alkali makes it very useful in the construction of vats and tanks, since it is not liable to taint foods and liquids.

It took the war to focus our attention

Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

on the fact that delay in construction is a thing almost unknown to wood. The very rapid erection of our military camps and cantonments is a very powerful testimony to the speed with which buildings of this material may be erected. Within ninety days from the time the contracts were let for some of the largest cantonments, thousands of troops were pouring into them and thus it was wood that won the first big battle in the war. Furthermore, it furnished the material for quickly constructed defenses and for bridges necessary in bringing materials and ammunition up to the boys on the firing line. Our boys recently surprised the Germans by throwing a bridge across the Rhine in forty-four minutes.

As a finishing material the use of wood is almost universal. Its wide variety of grains and its many soft and harmonious tones and pleasing textures make possible the large number of pleasing effects that are found in the field of wood finishing decoration. Wood may be cut for special decorative qualities, such as quarter-sawed oak or bird's-eye maple. It may be used as a decoration because of surface effects alone, or it may easily be shaped into refined mouldings and carved into delicate ornaments.

However, the greatest field for usefulness for wood is as a structural matemial. Modern development of machinery and equipment is so rapid that very few factory and commeriacl buildings attain and age of a quarter of a century without being entirely rebuilt, and remodeling is usually a necessity every few years. The mill construction type of building readily meets these conditions. It is not only cheaper in first cost, but changes and alterations are made readily with this type of construction. Structural timber used in this kind of building is often reframed and used again and again. In structural use, timber is not only light, strong and easily framed, but its toughness and elasticity make the sudden failure of beams and joists rare. It is used where sudden loads and shocks are frequent, and not only absorbs the shock, but also the noise which might become very annoying.

For bridge and factory floors, as well as for stockyards, stables, garages, railway stations and the like, wood blocks make a light, quiet, comfortable floor, which "stands the gaff" like a butcher's block. It is not cold to stand upon, is comparatively noiseless and readily repaired when necessary. It has been tried out as a flooring material for baggage cars recently. Its long life under the severe conditions and requirements of this service has proved its value for that purpose.

The introduction of modern methods of wood preservation have opened up a new and wide field for the use of wood. To other desirable qualities of wood, it has added a resistance to the attack of moisture and other destructive agencies, which have heretofore made the selection of a proper material difficult. When used for tanks and flumes, it resists the action of frost and water and allows repairs to be easily and quickly made.

Wood also has the advantage of a very wide availability. Wood for building purposes can be procured in almost every city, town and village in the country and in sizes which are most commonly used in the erection of buildings. Further than this, men are to be found everywhere who are familiar with its use, and can quickly and properly handle the erection of a frame building.

With all the qualities which wood brings into the service of man, its cost is low. The processes of manufacture and distribution have been the subject of careful study and economiacl administrations. The demands of the great war on the industries and the constantly rising level of prices, have affected lumber the least of any of the important building materials. The rise in the general level of materials and also the wages of workmen, have been so rapid in comparison with lumber that thousands who never before could afford to build are now in a position to build for themselves cozy homes, which will bring them content and happiness.—*National Builder.*

* * *

People who want to buy things do not catch the seller, chloroform him and cram the orders into his pocket.

Advertising is the proper education of the public as to where the thing can be found, and therefore it is a necessity.

We are parts and particles of each other, but a little of the kindly glue of human brotherhood is needed to fasten us together. The policeman who keeps the crossing clear, and at the same time informs us as to the location of the post office and the First National Bank, no doubt is, in one sense, an economic waste. On the other hand, he is an economic necessity. He is a necessary middleman.

He relieves the congestion of traffic and granting the hypothesis that he does not misdirect us as to the location of the post office, he speeds us on our way.

You can't expect to do your "bit" of this busy world's business unless you enlist in the advertising ranks.

Repitition tends to create habit, the more often we see, do or hear a thing, the quicker we are likely to be influenced by it. The consecutive appeal of a number of advertisements will develop certain memories and associations tending to overcome the natural habit of procrastination.—Making advertising pay.

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building magazine this side of Manhattan Island.

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

"WHAT FOOLS THESE MORTALS BE."

An able honest man, if poor, is a damphool!
An able dishonest man, if "smart," is sometimes rich;
But while an able, honest man, if smart, should be rich, an
Able crook, however rich, is nothing but a damphool! **WILLIS POLK.**

When business is slow for some reason or other,—is the very time to advertise. When your car gets stuck on a muddy bit of road, you don't go and sit on the bank, —you push, to put it across. Do the same with your business.

Ideals are like stars; you will not succeed in touching them with your hands, but like the seafaring man on the desert of waters, you choose them as your guides, and, following them, you reach your destiny.—Carl Schurz.

All advertising pays—even that which is poorly constructed. A bad ad. is better than no ad. at all. It is worth all that it costs in the competitive world of the present day, merely to keep one's name where the possible buyer cannot help seeing it To be out of sight in the commercial world is to be out of mind.

The only road to advancement is to do your work so well that you are always ahead of the demands of your position. Our employers do not decide whether we shall stay where we are or go on and up; we decide that matter ourselves. Success or failure is not chosen for us: we choose them for ourselves.—H. W. Mabie.

Building Lime—Buy pure lime, no core, no grit—Chemical Lime. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Phila. Both 'phones.

Brownstone Bricks

Reading Sidings.

These are high grade pressed bricks, manufactured of crushed stone and hydrated lime. Greater crushing strength and lower absorption than burned clay. Uniform in shape and size. No soft ones. They are beautiful, economical and everlasting.

Red, Gray & Buff Face Bricks

A complete range of colors. Manufactured of vitrifying shale and fire clay. Our prices defy competition.

Straight Hard, Stretcher and Salmon Bricks

All Shale Bricks in carload lots, delivered on job at competitive prices. We are shipping 200,000 bricks daily to 28 building operations.

Vitrified Paving Bricks

Standard specification pavers at lowest market price.

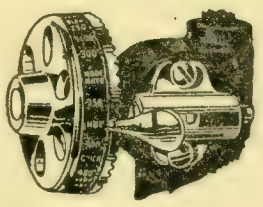
BUILDERS' SUPPLIES

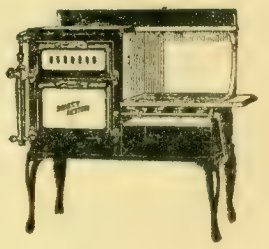
To be assured of prompt deliveries of the best grades of

Cement, Lime, Sand, Gravel, Plaster, Concrete Stone and Pebbles

Place your orders with us. We have for years satisfied our customers. **WHY NOT YOU?**



P. H. FAIRLAMB CO. - 115 to 121 S. 30th Street Philadelphia

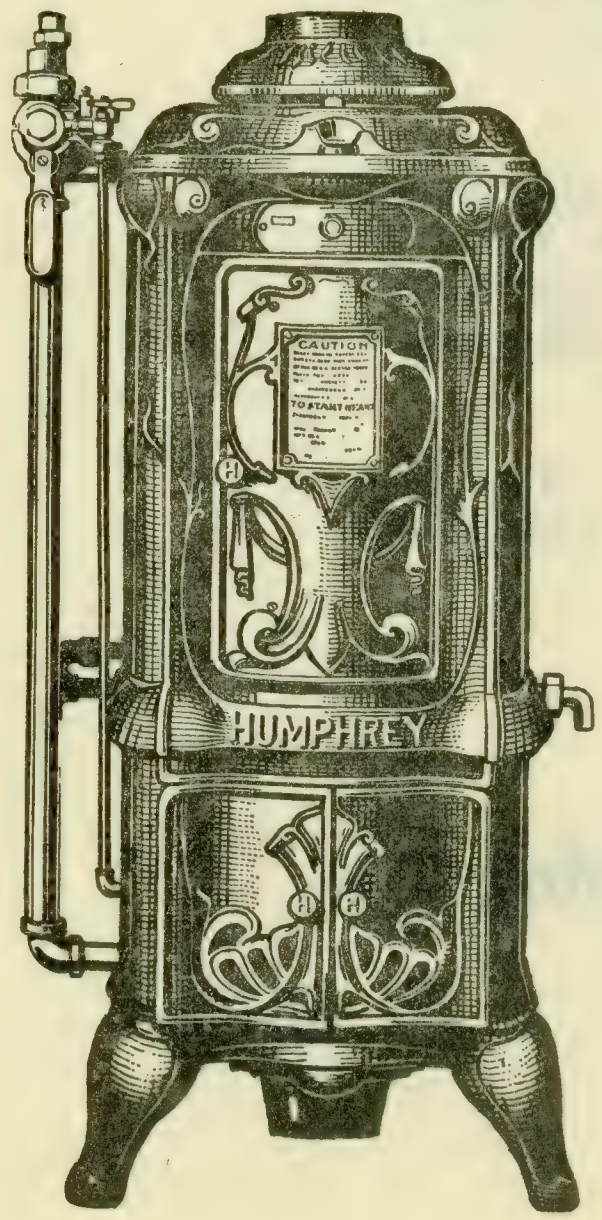


One of the many "reasons why" so many homes in and near Philadelphia are being equipped with the

Direct Action Gas Range

is that its patented oven heat regulator eliminates all guess work in cooking and enables one to obtain the same results at all times. It SAVES GAS, TIME, FOOD and WORRY!

We have it connected up with gas on our sample floor and shall be glad to have you and your clients call any time to witness a demonstration. An attractive booklet showing the entire line is yours for the asking.



BORDEN STOVE CO., 1311-1313 Arch St., Phila.

The Touraine Apts, 1520 Spruce street; the Daniel E. Hogan Operations at 54th and Wynnefield avenue, and 60th and Columbia avenue; the William Pilton Operation at 5959 Larchwood avenue; and the Presser Operation at Yeadon, Pa. are a few of the many operations which are enjoying the advantages of the DIRECT ACTION GAS RANGE.

Hot Water For All!

IT matters not whether one or a dozen baths are wanted, the Humphrey Automatic Gas Water Heater supplies all the piping-hot water required—without forethought—without preparation—without keeping up a fire—without even striking a match.

A thorough acquaintance with the modern Humphrey Automatic Gas Water Heater will certainly lead to your clients and friends coming to enjoy this up-to-date, dependable hot water service in their homes.

Gas is the ideal fuel, burning without muss or attention, saving labor, worry and money. "Hot Water Like Magic," the Humphrey way lightens the burdens of house work and promotes cleanliness and hygiene in the home.

There's a size and style to meet the hot water needs and pocketbook in cottage or mansion. Opening the faucet lights the gas, closing automaticaliy shuts it off. Outside the tiny pilot spark, gas burns only when hot water is drawn—a cupful or a tubful—any hour, day or night.

Let Humphrey excellence serve your customers with hot water. Ask us about sizes and styles to specify. Guaranteed, of course.

New Advertising Campaign Service

Plan of Builders Guide

A plan whereby advertisers are assured the best advertising campaign and copy service they have ever had.

This unique plan consists of a series of twelve ads written by our Advertising Service Department, specially trained in technical advertising. These twelve carefully prepared ads are submitted to the advertiser before the contract becomes effective. The first ad of the series appears after all twelve ads are approved by the advertiser. The twelve ads are run in rotation.

This advertising campaign service plan means that a new ad appears each week to strike your prospect from a new and different angle; thus you smash your message to him in the most forcible manner possible.

Remember, advertising is selling. This plan gives you a chance to do your selling scientifically and systematically.

Artesian Wells.

Engineer & Contractor

Water Systems for Farm, Factory or Town

Experience Teaches

Have your water system installed complete under one contract. This eliminates any chance of errors in locating, capacities, etc., to suit your conditions and requirements.

Get the benefit of our experience.

We furnish all labor, materials, pumps, motor or, in fact, any and all necessary items to complete your water system.

Boiler and Pipe Coverings.

Nonpareil
Cork Covering

Nonpareil will not absorb moisture by capillary attraction because of its cellular structure. Nonpareil is coated inside and out with a waterproof mineral rubber finish. Nonpareil provides absolutely the best cold pipe covering obtainable.

COMPOSITION FLOORING

Science Discovers The Perfect Floor

Resilient - Wearproof - Sanitary

Science has found the three great qualities of an ideal floor in Mineral Flooring.

The resiliency of a woodland path, the wearing qualities of granite, the cleanliness of a clean china dish are combined in Mineral Flooring.

Mineral Floors are made of two elements, minerals and chemicals. Mineral products are brought all the way from the mountains of California, charged with chemicals and treated by a secret process—but, the remarkable feature of this flooring material is that it combines resiliency with greater wearing qualities.

Mineral Floors are laid in plastic state, they fill every crack, corner and crevice—they seal everything underfoot hermetically, and provide a smooth even surface over rough uneven floors.

There are other wearproof floors, there are other resilient floor coverings, but resilience, wearing qualities and sanitation are obtainable only in genuine Mineral Flooring.

Contractors' Equipment---Continued

A Reliable Source for Mechanical Equipment

All Factory Buyers for factories find that all of their mechinical needs are met in the lines sold by the Fairbanks Company. They know that they can send an order for their wants to us and have their order filled promptly and usually in one shipment. They make one clean-cut transaction instead of half a dozen scattered dealings. And

The Fairbanks Company O. K. Our Guarantee

assures you of right prices, standard quality, and prompt deliveries. It means that the good will of the Fairbanks Company, with its many years of experienced service to factories, is behind this guarantee.

Cork Flooring.

LINOTILE FLOORS

Linotile is a composition of clean powdered cork, wood flour, linseed oil, various gums and color pigments. Linotile is a distinctive artistic floor covering—resilient, noiseless, sanitary, durable and moderate in cost.

It is particularly adaptable for stores, offices, restaurants, lobbies, elevators. hallways, lodge rooms, kitchens. etc.

ISKO *REFRIGERATION WITHOUT ICE*

Silent, Tireless, Automatic ISKO Manufactures Cold

Isko will convert the ice box you now have into a miniature cold storage plant. Vegetables entrusted to Isko stay garden-crisp. Isko keeps milk and butter fresh and sweet. Isko supplies cubes of pure ice for table use. And all electrically, without the ice-man and his tongs, without ammonia and its dangers.

Furnaces, Boilers, Radiators

NOVELTY Smokeless Boiler—The Boiler with the Carburetor

NOVELTY Round Boilers
for heating with hot water, Steam or vapor

NOVELTY Warm Air Furnaces---Pipe and Pipeless Types

Your Prospective Buyer or Client knows the

NOVELTY LINE

They know it stands for absolute satisfaction — quality as to material and construction; ease and economy as to operation.

Extensive advertising keeps these products constantly before the public and thousands in use are the best proof of their merit.

NOVELTY BOILERS-FURNACES-RANGES

Made in Philadelphia—sold throughout the world—since 1847.

They are made of FLEX-O-TUF cast iron—our exclusive mixture of the highest grade pig irons. (Sample sent on receipt of request)

So when you install NOVELTY or FORTUNE products no explanations are necessary—your prospect already knows the name and what it stands for.

Visit our attractive factory show room at American and Dauphin Streets where the full line is on display.

Our engineers are at your service at all times to co-operate in solving heating and cooking equipment problems.

Install NOVELTY or FORTUNE Products-And be Sure.

Gas and Electric Fixtures---Continued

No Building Is Complete Unless Fully Piped For Gas

Necessary modern conveniences are lacking in many structures built a few years ago, because they were not provided for at the start.

A vital error in planning a house now would be failure to arrange for an up-to-date Gas Range, a Gas Laundry Stove and a Gas Automatic Instantaneous Water Heater or Automatic Storage Water Heater. These appliances should be in the original specifications.

Don't overlook suitable gas outlets for Heating Stoves, Fire Places, Bracket Lights, Floor and Table Lamps and a Bath-room Wall Burner. The occupant will want them, and the economical and convenient way is to provide for them in the beginning.

In the shop and factory there are scores of processes requiring Gas Fuel, and piping should be specified to take care of them.

Our practical men know the best ways to pipe a building; where and how to place the outlets; how to insure the right supply of Gas at all points—things which should be considered when the plans are being drawn.

Call Locust 1300 (Bell) or Race 30 (Keystone) and ask for the New Business Department; or drop a letter or post-card. We shall be glad to co-operate with you.

LUMBER

JANNEY

POLICY

The lumber company that neglected to give SERVICE would be in as bad a fix as a grocer who sends customers away without a bag to carry sugar purchased at the store.

The policy of this company recognizes SERVICE as the first fundamental, but JANNEY does not stop there. JANNEY gives you lumber plus service plus a satisfactory price.

It is to your own interest to investigate a conception of SERVICE as broad as that dictated by the JANNEY policy.

LUMBER

JANNEY

GROWTH

Judge a man by his progress. If he keeps moving ahead he's worth something.

Judge an organization by its growth, for growth reflects progress.

If you don't know what it means to deal with an ambitious, push-ahead crowd, just send in a little rush order for anything from a dozen feet to a dozen million.

Lumber—Continued.

LLOYD

PLANS OR NO PLANS

There are two classes of builders who need the help of a strong, modern lumber centre,—those who have *planned* their operations well, and those who haven't.

If you have planned well, you will need a strong organization to help carry out your plans. The best is none too good. In big building operations, all of our experience and resources, including the powerful aid of our Traffic Department, are constantly required.

But if you have *not* been able to make careful plans; if you are forced to build hastily and under pressure, then only an uncommonly strong organization will enable you to accomplish your purpose. When you need unusual stocks or service that you have no right to expect, then the resources of the LLOYD organization will often save the day for you.

Some day you will build. If you want the work finished on time, see that the lumber comes from LLOYD.

WILLIAM M. LLOYD CO.

The Secret of Successful Advertising

has been found by experience to be centered on the one word Dominate.

Dominate the mind of your prospect, suggest to him in a thousand different ways that he try your product, show him the advantages of buying from you, keep your name so constantly before him that he can think of no other manufacturer.

Our direct (by mail,) Service Plan enables you to dominate your prospect's mind at a reasonable cost. The plan consists of a Daily Service to give you the names addresses of the owners, builders and architects of new buildings. We write and have printed 6 to 12 sets of booklets or mailing cards, all different and all dealing with your product.

Then we supply you with a card index to enable you to follow up effectively every propect.

Write to us for further information

Perry Building, Philadelphia, Pa.

METAL CEILINGS

51 Years of Successful Service

Has Demonstrated the Value of "Penco" Products

We are Manufacturers of the Following Material

"Penco" Metal Ceiling and Walls.

Suitable Designs for every character of Building. Estimates cheerfully furnished in any locality.

"Penco" Metal Lath

Made from the famous Hampton Iron, the rust resisting metal. Cut in sheets, 24" x 96", packed 16 square yards to the bundle. Specified by leading Architects and Engineers.

"Penco" Metal Cornices and Skylights

Special work made from Architects' Details. We are equipped to handle all kinds of sheet metal work. For the trade or erected.

"Penco" Metal Corner-Bead

Made in 6 different types. Look along the edge of the bead you are using and compare it to the "Penco" bead. Our beads are made on micrometer dies and are straight.

"Penco" Fire Doors

Tinclad or Kalamein for the trade. Furnished with Hardware complete. Prompt Delivery.

"Penco" Metal Roofing and Siding

All kinds of Metal Roofing. Large stock for immediate delivery.

Fire Proof Building Materials

Arches, Bins, Ceilings, Channels and Purlins, Corner Bead, Corrugated Sheets, Culvert Pipe and Flume. Doors and Frames, Expanded Metal Fire Doors and Hardware, Metal Lath, Roofing and Siding, Shingles, Studs.

Spruce 4958 Race 342

Paints and Varnishes---Manufacturers and Dealers

Five Reasons

Why You Should Use or Specify

Zementine

The Perfect Water Paint

FOR ALL INSIDE SURFACES

1. Does not rub nor peel off.
2. Goes twice as far as others.
3. Inexpensive, durable and of fine appearance.
4. Can be applied with either spraying machine or brush.
5. Does not lap.

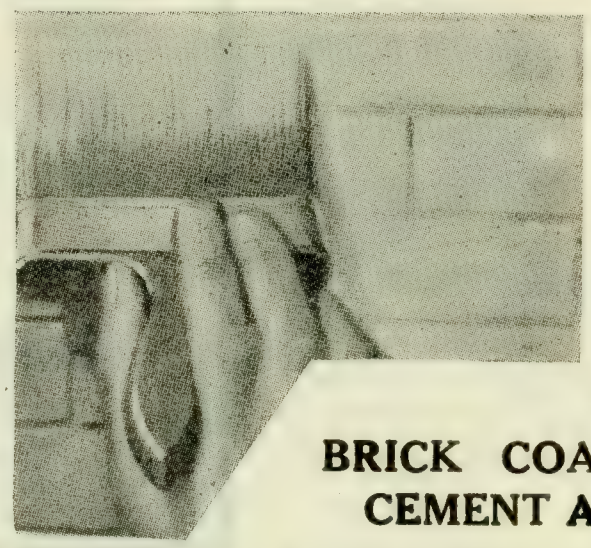
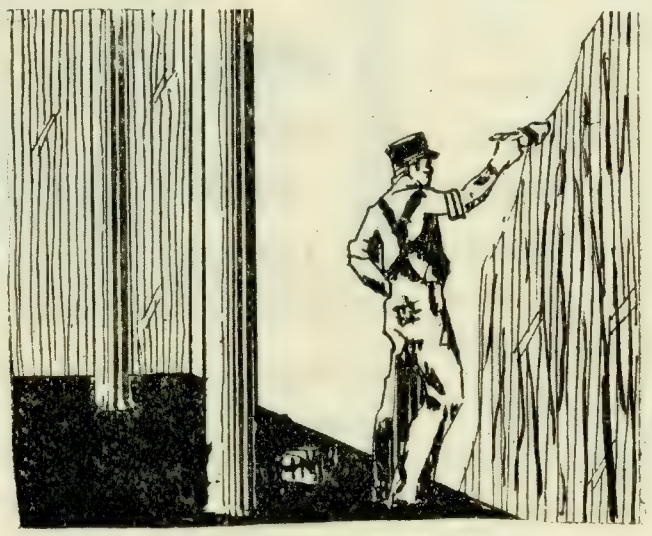
Have you read the Builders Guide this week

PAINTS and VARNISHES



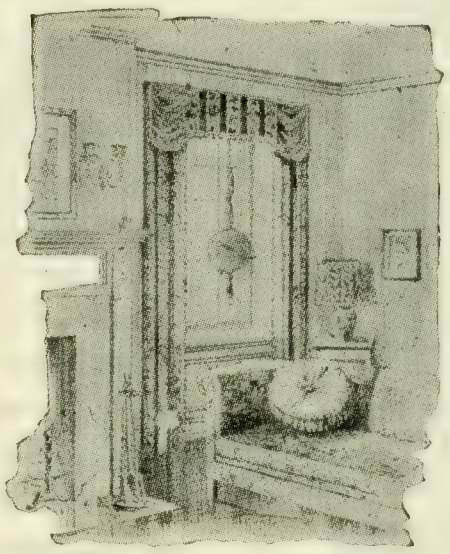
Manufacturers and Dealers---Continued

IMPACO



FURRING COMPOUND

Impaco Damp Resisting Paint provides perfect insulation between brick wall and plaster coat. Permanent, pliable, elastic, damp and waterproof, it forms a perfect bond that enables the builder to do away with time consuming, expensive, furring and lathing.



BRICK COATING CEMENT AND

Impaco Cement Coating produces varied attractive color effects. It replaces the cheerless and unattractive appearance of a cement surface with a flat, soft toned artistic appearance. It is waterproof and is unaffected by the alkalies in cement and brick, which destroy oil paints. Impaco Cement Coating in cement floors produces a hard durable surface that will not clip or peel off.

MILL WHITE

Impaco Mill White is scientific Mill White. *Impaco* reflects every atom of daylight that enters a building—reflects without glare—and provides better illumination for every part of the room.

FLAT FINISH

The *Impaco* line of durable, attractive oil paints for interiors provides a selection for any kind of interior painting work. The color card of Flat Finishes will indicate the possibilities of artistic treatment of walls and ceilings with *Impaco* Paints.

Keith's Theatre Building
Philadelphia

Roofing Materials---Continued

SIX years ago, we told architects that they had "better break the pen" before writing "*or equal*" in their roofing specifications.

It was important then but is even more important now, because Barrett Specification Roofs carry a Surety Bond Guarantee.

No "*or equal*" roof dares to give such a bond.

IN writing your roofing specifications it is important *not* to add the loophole phrase "*or equal.*"

An "or equal" Specification puts the honest contractor at a disadvantage and leaves the way open for any less scrupulous bidder to "skin the job" by using inferior materials and construction.

If you will write into your roofing specification simply this—"The roof shall be laid according to The Barrett Specification dated May 1, 1916, and the roofing contractor shall secure for me the (20- or 10-Year) Surety Bond therein mentioned," you will be assured of several important things—

First—You will have the benefit of competitive bidding, on an equal basis, among roofing contractors.

Second—You will receive the Barrett Inspection Service *without charge.*

Third—Your roof will be guaranteed by a Surety Bond to be free from maintenance expense for the guaranteed period.

Fourth—You will have a roof for which there is positively no "or equal."

The Surety Bond Guarantee

The Surety Bond is offered on all Barrett Specification Roofs of fifty squares or more in all cities of 25,000 or over, *and in smaller places where our Inspection Service is available.* It is issued by the U. S. Fidelity and Guarantee Company, and exempts the owner from all maintenance expense for the life of the Bond.

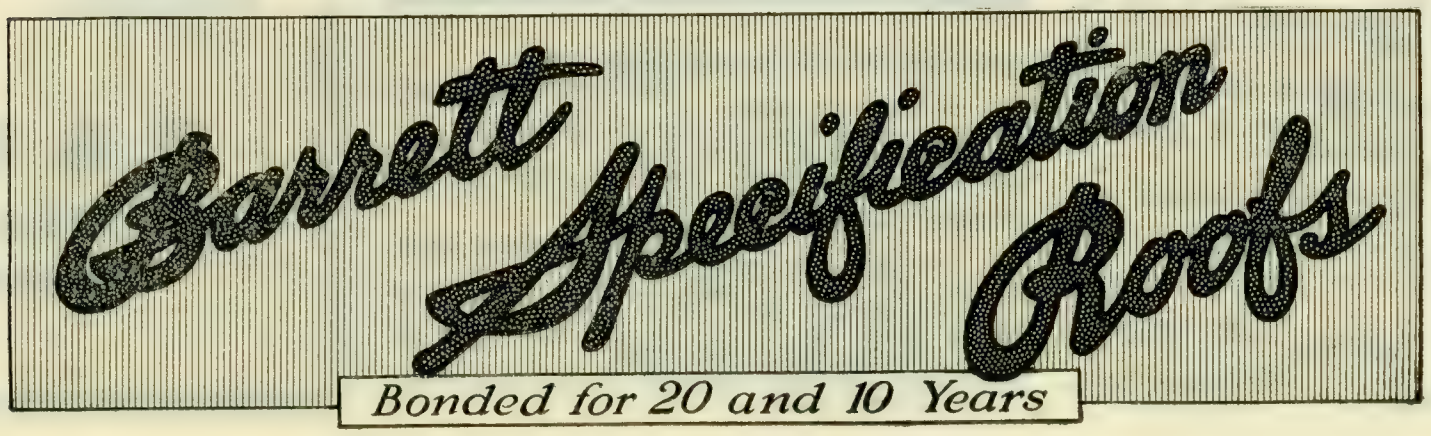
Our only stipulations are that the Barrett Specification dated May 1, 1916, shall be strictly followed and that the roofing contractor shall be approved by us and his work subject to our inspection.

These roofs take the base rate of insurance and cost less per year of service than any other type of "permanent" roof.

Important Notice

The Barrett Specification 20-Year Bonded Roof represents the most permanent roof-covering it is possible to construct, and while we bond it for twenty years only, we can name many buildings carrying this type of roofing that have been in service over forty years and are still in good condition.

For those who desire a lighter and less expensive roof covering, we recommend the *Barrett Specification 10-Year Bonded Roof.*



Both roofs are built of the same high-class waterproofing materials, the only difference being the amount used.

Full details regarding these Bonded Roofs and copies of The Barrett Specification sent free on request.

Safety Treads.

UNIVERSAL SAFETY TREAD

Absolutely NON-SLIP at all stages of its wear

This is peculiar to the Universal Safety Tread, the feature that makes it superior to other Stair Treads. From the time of its installation until it is entirely worn out, it presents a continuous surface of Lead, **absolutely non-slipping.**

For Wood Iron Concrete Stairs

Treadplate BEFORE and AFTER LEAD is rolled in

Your Best Prospect Is The Man Who Needs Your Material

Any one who sells knows that the best prospect in the world is the man who is in need of, or wants the product or service you sell.

How can you know who that prospect is? How can you save your salesmen's time and energy by eliminating those prospects who are not immediate prospects?

The answer in the building game is

Daily Building News

On your desk every morning, you can have these live report sheets give you the inside dope on all proposed construction work, all jobs on which bids are being taken, all work on which contracts are being let.

This complete, reliable service covers Philadelphia, Eastern Pennsylvania, Southern New Jersey and Delaware.

Waterproofing

We sell no materials. Our work is exclusively Engineering and Contracting

We are Contractors and Engineers in the waterproofing of *Walls—Floors—Basements—Reservoirs — Subways — Tunnels—Viaducts—Oil Tanks*—in fact, anything built of Concrete, Stone, Tile or Brick.

"Ironite Waterproofing," which has stood the test of time, is used almost entirely. Our experience has proved it to be complete and permanent in its moisture resisting qualities.

All of our work is done after the structure is built and the surfaces are usually treated on the inside against any hydrostatic pressure.

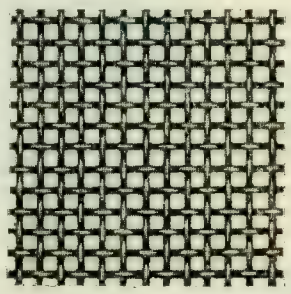
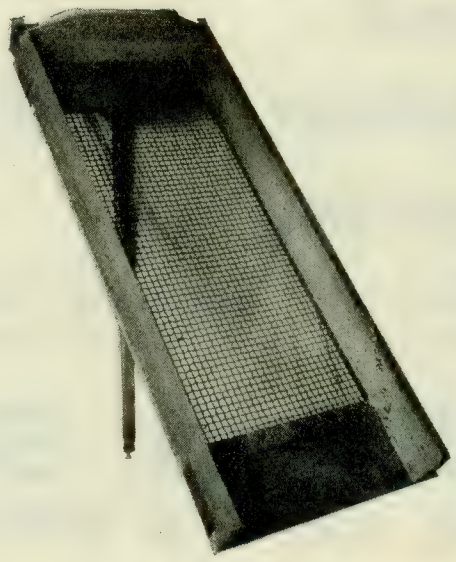
WIRE and WIRE WORK



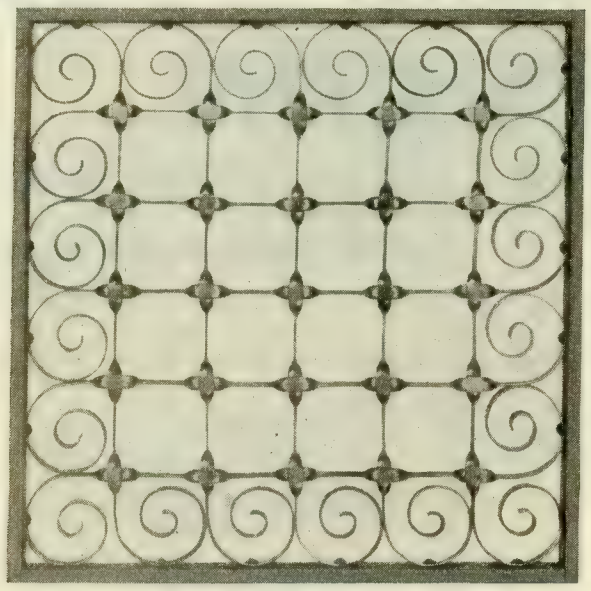
AUDUBON WIRE CLOTH CO. INC.



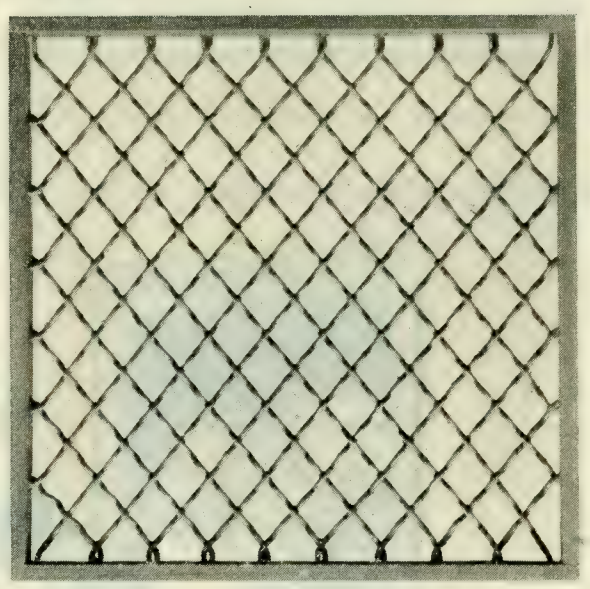
MANUFACTURERS

Daily AUTO TRUCK Delivery in Philadelphia

Wire Cloth



Sand Screens



Made especially to meet the requirements of Contractors, Cement Manufacturers, Dealers in Building Materials, for a strong, durable screen for cleaning sand and gravel.

The construction is of Steel Bar Wire—gauge, accurately spaced. Heavy frame of well seasoned lumber.

This type of Screen is also adapted to the needs of brickmasons, etc., for the screening of Mortar.

Sizes and prices on application.

Audubon Wire Cloth is manufactured to meet the practical requirements and the most varied needs of a wide field of industrial and commercial activities. Every branch of industry where wire cloth is employed as one of the mechanical utilities can be served with greater economy and efficiency by the adoption of the special weave, fabric or shape, best suited to its individual requirements. Our facilities for meeting these demands enable us to ofier a service that will commend itself to the discriminating purchaser.

Elevator Enclosures

The illustration shows one of the many different designs of ornamental Elevator Enclosures we are prepared to furnish.

As the work partakes largely of a special character the price depends on the number and size of pieces, finish desired, etc. It is always advisable to furnish specifications when asking for quotations.

Furnished in Dull Black, Steel Oxidized Copper, Electro Plated Brass or Bronze or Polished Brass.

Window Guards

In ordering Window Guards always state which is the "height" and which is the "width" in furnishing dimensions; thus: 23 ins. wide x 36 ins. high.

State Mesh and Number of Wire; whether Channel or Round Iron Frames are desired and the size of the same.

Be sure to give exact size guards wanted when finished. outside to outside.

We finish in black paint unless otherwise ordered.

For irregular shapes, or semi-circle or gothic tops, send detailed drawings.

WOOD BLOCKS

Kreolite Blocks in MAZDA National Lamp Machinery Production Plant ---70,500 sq. ft. used to re-surface concrete floors

Kreolite Wood Block Floors are ideal for installation in both old and new factory buildings.

They are practically indestructible under the grinding wear of heavy factory trucking, yet they are warm and springy underfoot aud furnish a smooth, resilient surface impossible with any other material.

Our process of thoroughly impregnating the well seasoned wood blocks with Kreolite Preservative Oil accounts for their ability to endure almost indefinitely.

The National Lamp Works of General Electric Company at Nela Park, Cleveland, has had occasion to prove to their satisfaction the great value of Kreolite Wood Blocks for re-surfacing old floors.

They recently purchased a factory building in which to manufacture the machinery and equipment which produces the intricate parts of the MAZDA Lamps. The building had cement floors which they thought unsuitable for this work; accordingly they decided to install Kreolite Wood Blocks over the cement floor, which change was quickly and economically made. This building has a floor space of over 70,000 square feet and contains hundreds of individual motor-driven machines.

Kreolite Grooved Blocks were used in this installation. The old floors were given a thin coating of Kreolite Pitch and the blocks laid directly over them. The grooves permitted an absolutely watertight seal and binder to be poured into the joints, forming a smooth, resilient and enduring monolithic surface.

Brownstone Bricks

Reading Sidings.

These are high grade pressed bricks, manufactured of crushed stone and hydrated lime. Greater crushing strength and lower absorption than burned clay. Uniform in shape and size. No soft ones. They are beautiful, economical and everlasting.

Red, Gray & Buff Face Bricks

A complete range of colors. Manufactured of vitrifying shale and fire clay. Our prices defy competition.

Straight Hard, Stretcher and Salmon Bricks

All Shale Bricks in carload lots, delivered on job at competitive prices. We are shipping 200,000 bricks daily to 28 building operations.

Vitrified Paving Bricks

Standard specification pavers at lowest market price.

CARRY THE HOD!

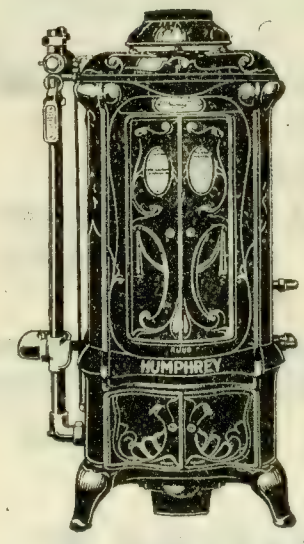
Do you use the hod carrying method of raising bricks, mortar and cement?

It's slow, costly and uncertain.

We have devised a small, inexpensive Hoist operated with a gasoline engine for the small contractor.

Easy to assemble, easy to operate, easy to move.

Equipment includes nine wheel barrows, two cages, iron guides, hoist, engine and cable.



Twenty-five in operation in Phila.

As The Editor Sees It

COMBINED with this issue of the GUIDE is a directory of the Architectural and Building Trades of Philadelphia. So many inquiries for manufacturers, distributors, agents and what not in building materials are made daily at our offices that a directory was deemed advisable. This is a service we are giving to the building trades.

Copies of the directory have been distributed to all listed in it at no expense to the recipient. The utmost care has been taken to avoid overlooking any individual or firm that should be included in the classifications. Blanks were mailed to all listed in the directory, before going to press, requesting information that would enable us to check the names, addresses, classifications and phone numbers. Co-operation on the part of some was lacking. We are grateful to those who promtply furnished us data to supplement our work. Constant changes and additions may have caused omissions. If such occur, corrections will be gladly received so our records may be kept up to date.

The building news section of this edition of the GUIDE is a regular weekly feature, and contains reliable advance information covering building projects in, not only Philadelphia, but in Pennsylvania, New Jersey and Delaware. Where can you find more dependable prospects for your products and services? How are you keeping abreast of the tide of building that is sweeping the country? Why not get your share of the good work? If you are not a subscriber to the BUILDERS' GUIDE, send in your subscription now and you will be assured an abundance of live prospects for fifty-two weeks. The cost is trifling, only five dollars for the whole year's subscription.

* * *

THERE are so many changes taking place daily in the business world, and particularly in the construction field, that it is difficult to keep abreast of the kaleidescopic situation. Of one thing we are certain—the need for a big building program throughout the country is still urgent, and, so far, no adequate solution of the housing question has been found. In fact, we read that:

"With the beginning of spring the shortage of dwellig houses seems to be as acute as ever without any promise of relief in the near future. In Philadelphia and elsewhere distracted citizens are begging the authorities to help them to get a roof over their heads. In New York a great meeting was held in the Mayor's office, which was attended by capitalists, land owners, builders and members of the labor unions. All expressed a willingness to do their part in supplying homes for the homeless, but at the outset obstacles are presented because of disputes between the various labor organizations.

Bricklayers unaffiliated with the Building Trades Council decline to permit that organization to make agreements for them, saying that they have been in the habit of making their deals direct with their employers. Plumbers and others refuse to work with insurgent carpenters. Construction is further delayed by differences between the Iron Erectors' League and the Building Trades Council, which refuses to allow its members to work on buildings where the steel has been put in place by the open shop employees of the League. The Mayor of New York, who is the sponsor for these statements, says: 'I am satisfied there are seven or eight men in this city who have it within their power to say the word that will launch a building boom which would be the greatest in the history of the world.'

If this be true it is a deplorable situation. It is a pity if men are not able to get together and adjust their differences for the sake of the common good. We hear a great deal of complaining about profiteering these days, and much of it is justified, but it is evident that conditions would be materially improved if a give and take policy were inaugurated. Some men who work for a living often make it very hard for others who also have to earn their bread by the sweat of their brows.

DRAWING MATERIALS

BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 614

BLUE PRINTS

Just such conditions exist all over the country, with Chicago and one or two other places touching the high-water mark of labor trouble.

There is, in addition to labor troubles, the great question of scarcity—whether real or supposed—of materials.

We urge everyone to keep himself posted concerning the digerent and changing aspects of the business and building situation. Know what is happening—then carry on the propaganda—inform your fellow worker, your employee. There are many solutions to the problems confronting us today, but they don't get much further than the paper they are written on. It will take the co-operation and effort of everyone, everywhere, to straighten out the snarls, and, not until we have learned to pull together—employer, employee, producer, consumer—will business and the construction industry is a most important industry at present, be what we are all wishing for.

Therefore get together! Acquire the facts of the situation, pass them on, and then co-operate.

ACTIVITIES OF THE BUILDERS' EXCHANGE.

Architects, Please Note!

An open invitation is hereby extended to all architects to attend the weekly luncheons of the Master Builders' Exchange, in the Clover Room of the Bellevue-Stratford Hotel, on Thursdays, from 12.30 to 1.30 P. M.

Prominent speakers, entertaining music and a delightful luncheon serve to make this a pleasant hour, and we would be pleased to have you with us.

Tickets for the luncheons are in series of four at five dollars ($1.25 each), and may be purchased at the office of the Builders' Exchange, or will be sent by mail upon receipt of check.

Please accept this as a cordial invitation to be with us each week.

Yours very truly,

MASTER BUILDERS' EXCHANGE,
E. E. HOLLENBACK, President.

"COLLECTIVE BARGAINING"

The principle of collective bargaining as a method for the settlement of the various questions affecting wages, working conditions, and other problems which are almost continuously an issue between employers and employes, has been much to the forefront since the introduction of a resolution approving this principle, before the Round Table Industrial Conference called at the instance of President Wilson, created, or brought out, so marked a dicerence of opinion on the subject as to practically disrupt the Conference and almost completely nullify the work of this body from which so much had been expected.

The right of workers to bargain collectively is recognized to a great extent throughout the industrial world and the practice is becoming increasingly prevalent as time goes on. Whether or not the acceptance of this principle by employers is because of belief in its justice —or because in these days of efficiently organized labor it is expedient to accede to the workers' demand for the right to bargain for a group through the chosen representatives of that group—does not enter into the point it is the purpose of this article to draw attention to.

We believe the principle itself is on trial both in the building industry, where it generally has been in effect for many years, so long in fact that builders, particularly in the large centers of population, are committed to it; and in a number of other leading industries where its application has been comparatively recent; and we believe the success or failure of this principle will be determined entirely b, the attitude of the labor unions with respect to the keeping of agreements entered into by their representativs. If the unions, or any group of employes who enter into agreements with employers, can and will insist upon a strict adherence to the spirit and letter of such agreements, we believe a greater confidence will be felt by employers and the confidence thus established will be the greatest single factor for the success of the principle. If, on the other hand, unions of workmen, either because of selfish interest or because of inability to compel compliance by their members, permit a disregard of obligations, the plan is doomed to failure. The employer will, under these conditions, naturally be averse to entering into contractual relations when experience has shown the inability or disinclination of the other party to abide by its agreements.

It is unfortunate that a feeling of this character has grown in the minds of employers and it should be the purpose of every representative of labor to do everything within its power to eradicate it. This can be accomplished in only one way—by a determined insistence upon compliance with all agreements entered into. We believe that every thinking labor leader is keenly aware of the necessity of establishing—or re-establishing—this confidence in the minds of employers, and we are hopeful that, if for no other reason than the value that will accrue to organized labor, a strong effort will be made to see that labor agreements are kept inviolate.—*Building Industry.*

* * *

A FABLE FOR BUILDERS.

Last Summer a Good Citizen of a Certain City not over one hundred miles from almost Anywhere, built a Wooden House for a Woman and her children. He Built the Chimney of Brick Because he had to. The Chimney was able to Stand Alone, so he did not have to Prop it with Wood. But the Floors of the House would not Stay Up without Props. The Good Citizen saved a Dollar by using the Chimney as a Support to the Floors. He Nestled the Ends of the Floor Joists nicely in the Brick of the Chimney. He Covered Up the Job and Got His Money.

The Rains Fell and the Winds Blew in the most Biblical manner, and Winter came after its Fashion. The Chimney Settled a Little, and there was a Tiny Crack.

One morning the Woman Woke Up with Fire All About Her. She tried to get Her Children. If She got to Them no one Ever Knew it. The Good Citizen who Built the House was Not Arrested for Manslaughter. He is building Other Houses of the Same Kind for other Women and Children.

He is making his Living by it.

F. H. WENTWORTH.

In Time of Fire

How important to you is the difference between guessing and certainty?

You can be certain that the NU-EX will always work.

IN the fact that fire apparatus is infrequently used lies a very grave danger. Most owners forget or neglect to inspect and test extinguishers as often as they should. Machines must be taken apart, examined carefully; tested for efficiency. Neither a pleasant job or a clean one.

More than that. You can never know whether an ordinary extinguisher will work or not when needed, until the emergency arises and you try. Then it is too late.

How much is a definite certainty of safety worth to you? The lack of it can cost a very great deal in both anguish and money. The value certainly on such a point cannot be measured in mere dollars.

When you have a NU-EX you can be absolutely sure of real fire protection--always. You cannot forget the NU-EX. Every time you glance at it you can see, instantly, that it is ready to serve you well

Nothing about it to take apart. No pumping to do. Nothing can go wrong. Automatic and instantaneous in action. Full particulars for the asking.

CHARLES Bond COMPANY

617 ARCH STREET, PHILADELPHIA

STORMTIGHT

Will Save Your Old Roof For Ten More Years of Stormproof Service

Here is a weatherproof, fire resisting compound adapted to use on roofing of any description. It is the only material that will successfully repair gravel, slag and corrugated iron roofs. Wherever wear, rust or corrosion have caused cracks and leaks to appear, Stormtight will effectively and permanently seal them up. Used as a complete covering, it makes a permanent, one piece job without seams or laps, at a very low cost. Heat, rain, storm or cold does not affect it. Stormtight comes in two forms plastic or liquid, and requires no skill to apply. Sold under a definite guarantee. There is no such thing as risk for you. Full particulars are yours for the asking.

GUARANTEE

STORMTIGHT applied in accordance with our instructions is guaranteed to give absolute satisfaction and to protect a roof from leakage and keep it watertight for a period of ten (10) years.

We will replace free of charge any quantity of STORMTIGHT which after having been applied in accordance with said instructions proves defective.

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

SHEETROCK

The Contractor's Choice

FOR years you have been looking for this standard wall in unit form. You have wanted a unit material rigid, uniform and fire-resistive.

Here it is—Sheetrock.

A sheet of pure gypsum rock, Sheetrock won't warp, shrink or buckle. Sheetrock will not burn.

On all framework and in all moderate-priced construction, Sheetrock makes a job you can be proud of. It pleases the owner.

You can go over the work with him—point out how evently the units of Sheetrock join in a flat surface—remind him it will not crack or warp or buckle or shrink—remind him it will resist fire—because it is a sheet of gypsum rock—Sheetrock

And the longer he lives with it, the more that customer is going to value Sheetrock and respect your good judgement in using durable, good-looking, economical Sheetrock. Whenever he has any other building to do, he will naturally think of you first.

Look for chances to use Sheetrock on alteration and repair work. Sheetrock comes in broad, flat compact sections, 32 and 48 inch widths—ceiling high. It cuts, saws and nails like soft pine.

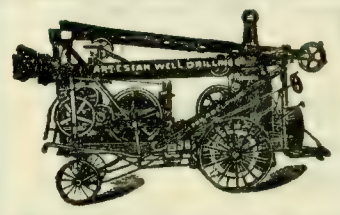
We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.



Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

ANCHOR POST FENCES

are built on anchor posts which are driven into the ground and then held rigidly erect by two Anchor stakes driven diagonally through slots clamped to the sides of the posts.

Iron Railings and Entrance Gates, Lawn Fences, Tennis-Court, Poultry and Kennel-Yard Enclosures, Arbors, Trellises, and Flower-Bed Guards. Catalogues of any or all are yours upon request.

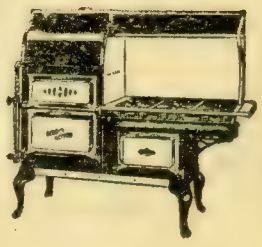
One of the many "reasons why" so many homes in and near Philadelphia are being equipped with the



Direct Action Gas Range

is that its patented oven heat regulator eliminates all guess work in cooking and enables one to obtain the same results at all times. It SAVES GAS, TIME, FOOD and WORRY!

We have it connected up with gas on our sample floor and shall be glad to have you and your clients call any time to witness a demonstration. An attractive booklet showing the entire line is yours for the asking.

As The Editor Sees It

EXTRAVAGANCE, profiteering, high prices demanded by labor, throughout this country, are beginning to cause serious reflection. On all sides there is fear expressed regarding the outcome of continued advances in the cost of everything.

The determined stand that Mr. H. W. Foote, President of the North Western Expended Metal Co., has taken against profiteering the whole building industry should endorse.

"Business is headed for a smash if profiteering doesn't stop," said Mr. Foote. "If advancing prices continue in material, labor and other lines, business won't need to worry about the future, because there won't be any business. Inflation of values always brings a collapse, and the country is indulging in a regular fever of such inflations now. It's time right now to head off the approach of such a serious situation as a panic would bring. And the only way to start the movement back to normal prices for everything is for someone, at his own sacrifice, to start it. This is what we are endeavoring to do in our line.

"I am of the firm conviction that business, in order to save itself, should cut its profits to the bone. It's good business in the long run. Let's have a moratorium on profits in every line for a while, for the sake of the country. Make it a matter of patriotism. I believe that labor will be glad to get in on it and do its share.

"I attended a convention the other day at which the general sentiment was that with labor demanding more and a premium having to be paid in order to get steel, an increase in price should be put on building materials. It was just another instance of the 'viscous circle.' I believe that profits should stand these increased costs as far as they should be, and that there should be no advance until it is absolutely necessary in order to keep business going.

"There is profiteering in every line. Let's admit it. We should get together now as American citizens, stop the 'vicious circle,' and bring back business to normal again. It's the only thing that will settle the unrest and will be the biggest benefit to labor and industry alike."

"The time has arrived to put on the brakes," says the *Architect and Engineer,* continuing: "Anent the movement throughout the country to stabilize prices we print the following letter from Mr. B. J. Williams, director of sales, Paraffine Companies, Inc., in the belief that it may encourage other large corporations like the Paraffine Companies to take similar action. The accompanying letter not only shows present tendencies and the inevitable outcome of their continued tolerance, but it points out the duty of the manufacturer, merchant, farmer, property owner, and, in fact, of every citizen, in these unsettled times:

TO THE TRADE

Conditions affecting the roofing industry and allied lines are abnormal and puzzling in the extreme. On the one hand the demand from the trade is larger than ever before and greatly in excess of the ability of manufacturers to supply. On the other hand, raw materials are very scarce—almost unobtainable, with prices at unheard of levels. Rags, for example, are now selling at $85 per ton, an advance of $30 per ton during the past six months.

The situation in the East is even more acute than on the Pacific Coast, some manufacturers having advanced prices three different times during January. Others have called in their salesmen, while a number are booking orders only for shipment at their convenience and at prices in effect when shipment is made. These Eastern conditions are already being reflected on this Coast in the form of greatly increased demand, and with advancing prices on the part of some manufacturers.

As to the advisability—indeed the necesity—of keeping prices down in general, there can be no argument. We, in common with thoughtful and patriotic citizens everywhere, recognize that prices cannot go higher without *extreme danger.*

How to meet the situation is the great

DRAWING MATERIALS | **CHARLES H. ROBBINS, JR.** 1209 Arch Street, Philadelphia BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 6-4 | **BLUE PRINTS**

question. Anticipating, in some degree at least, the conditions that would follow as a result of the restriction of building during the war, this company practically rebuilt its roofing plant at a cost of more than a million dollars. These improvements increased its output over 100 per cent., making it today the most modern, the most efficient and the largest single roofing plant in the world.

As a result of these increased facilities, our manufacturing costs are considerably lower than those of most manufacturers. Because of this fact and our sincere desire to assist in stabilizing prices generally, it is our purpose not to take advantage of prevailing conditions to exact the limit in prices. In other words, we will give our customers the benefit of our increased facilities and the stocks of raw materials which we have on hand, and will advance prices *only* when our present large stocks are exhausted and we have to replace at still higher prices.

In the meantime, we advise our customers not to speculate, but to buy to cover their *immediate requirements only*. If the building in sight in your city or community indicates a demand on you during the next three months for 100 squares, 500 squares, or a carload of roofing, *buy that quantity and no more,* but place your order *now* to insure delivery of the goods when you need them

We urge also that our customers in turn do not attempt to secure from their customers the highest prices obtainable, but that they be satisfied with a *fair and reasonable profit,* because, in our opinion it is only by so doing that, our mutual interests and those of the country at large can be conserved.

Business is founded on reciprocity and co-operation. Any other plan than this spells bankruptcy. The successful business nowadays has a heart and a soul.

BUILDER'S EXCHANGE ACTIVITIES.

At the luncheon of the Master Builders' Exchange Thursday last, Major General W. G. Price substituted as speaker of the day in place of District Attorney William D. McAvoy, who was unexpectedly called to Washington.

General Price made a very interesting address on the history and value of the National Guard to this country. He emphasized the importance of continuing the National Guard instead of making compulsory military training and service. General Price exhorted the members of the Exchange to use all their influence to further the National Guard and mentioned the names of various manufacturers and large employers of labor who have co-operated with the National Guard in its development.

The speaker at the luncheon at the regular place, Bellevue-Stratford Hotel, Clover Room, April 7th, will be Mr. D. Knickerbocker Boyd, the prominent architect of Philadelphia. Mr. Boyd will speak on a matter of vital importance to the building fraternity at large, emphasizing the necessity of greater co-operation between architects, builders and material men.

Mr. Thomas Armstrong, Chairman of the Luncheon Committee, urged all members of the Exchange to be present and asked each to bring an architect, so that co-operation between the architects, builders and material men may begin at the luncheon.

* * *

$100,000,000 FOR HOMES TO BE LENT BY BANKS.

Chicago bankers will lend $100,000,000 in 1920 to home builders in an effort to end the housing shortage, it is announced.

Part of the fund will be made available immediately to enable victims of the tornado to rebuild their homes.

PERSONALS.

Ellery K. Taylor, architect, has opened offices at 1627 Sansom Street, Philadelphia.

Mr. Taylor wants catalogues, literature and samples from all building material and supply houses.

Mr. Taylor was formerly associated with John T. Windrim, later with Day & Clauder, and recently Superintendent of Construction for Snare & Triest on the South Philadelphia Terminals.

* * *

Wm. R. Graham, formerly of Graham-Campion Company and James H. Wells, formerly of Metzger & Wells, have formed a partnership, for the transaction of a general contracting business in building construction at 3649-51-53 Filbert Street, Philadelphia.

Thirty yeyars of practical experience in buildings of all kinds assures the success of this firm.

* * *

ADDED LIFE FOR GALVANIZED IRON.

Many firms and individuals who use galvanized iron seem to believe that since it is galvanized, it is automatically proof against all forms of deterioration due to exposure to the elements. It is quite true that galvanized iron is one of the most durable materials of its weight and will stand quite a large amount of exposure before beginning to rust. However, continuous exposure to moisture will start the molecules of iron to rusting, and when once through the outer galvanized coat, the damage is done.

This could be avoided by the use of a galvanized iron primer. After a primer has been applied, a good rust inhibitive paint should be used. This gives life to the galvanized iron and also prevents the formation of rust which would occur if the iron were not painted.

ELECTRIC ELEVATORS OF HIGHEST EFFICIENCY FOR EVERY SERVICE.
LET US SHOW YOU.
Both Phones

--or equal

SIX years ago, we told architects that they had "better break the pen" before writing *"or equal"* in their roofing specifications.

It was important then but is even more important now, because Barrett Specification Roofs carry a Surety Bond Guarantee.

No *"or equal"* roof dares to give such a bond.

is NEVER equal

IN writing your roofing specifications it is important *not* to add the loophole phrase *"or equal."*

An "or equal" Specification puts the honest contractor at a disadvantage and leaves the way open for any less scrupulous bidder to "skin the job" by using inferior materials and construction.

If you will write into your roofing specification simply this—"The roof shall be laid according to The Barrett Specification dated May 1, 1916, and the roofing contractor shall secure for me the (20- or 10-Year) Surety Bond therein mentioned," you will be assured of several important things—

FIRST—You will have the benefit of competitive bidding, on an equal basis, among roofing contractors.

SECOND—You will receive the Barrett Inspection Service *without charge.*

THIRD—You will have a roof that is guaranteed by a Surety Bond to be free from maintenance expense for the guaranteed period.

FOURTH—You will have a roof for which there is positively no "or equal."

The Surety Bond Guarantee

THE Barrett Company is the *only* Company that has enough confidence in its roof to put back of it a Surety Bond. In fact, no other concern will guarantee a roof for so long a period, much less furnish a Surety Bond.

The Surety Bond is offered on all Barrett Specification Roofs of fifty squares or more in all cities of 25,000 or over, *and in smaller places where our Inspection Service is available.* It is issued by the U. S. Fidelity & Guaranty Company of Baltimore, and exempts the owner from all maintenance expense for the life of the Bond.

Our only stipulations are that the Barrett Specification dated May 1, 1916, shall be strictly followed and that the roofing contractor shall be approved by us and his work subject to our inspection

These roofs take the base rate of insurance and cost less per year of service than any other type of "permanent" roof.

When you have written the details of the Barrett Specification Roof in your contract, *stop there.* You will always be glad you didn't insert *"or equal."*

Important Notice

The Barrett Specification 20-Year Bonded Roof represents the most permanent roof-covering it is possible to construct, and while we bond it for twenty years only, we can name many buildings carrying this type of roofing that have been in service over forty years and are still in good condition.

For those who desire a lighter and less expensive roof-covering, we recommend the *Barrett Specification 10-Year Bonded Roof.*

Both roofs are built of the same high-class waterproofing materials, the only difference being the amount used.

Full details regarding these Bonded Roofs and copies of The Barrett Specification sent free on request.

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

SHEETROCK
WALL BOARD

SHEETROCK is not only cheaper than lath and plaster, but saves time and labor. It's made of pure gypsum rock, can be papered or painted as well as plaster, is stronger than wood, and won't burn, warp or shrink.

This scientific, fireproof wall board fills any plastering need. Instead of having to nail on lath and then troweling, and waiting for your scratch coat to dry, and your finishing coats to dry, you can nail Sheetrock to walls or ceilings and they are ready for paint, paper or panels.

Ask for a sample and you'll see for yourself why the Government has used over 5,000,000 feet of Sheetrock.

Greatly Outlives Wood Wall Boards and Costs About the Same

STORMTIGHT

Will Save Your Old Roof For Ten More Years of Stormproof Service

Here is a weatherproof, fire resisting compound adapted to use on roofing of any description. It is the only material that will successfully repair gravel, slag and corrugated iron roofs. Wherever wear, rust or corrosion have caused cracks and leaks to appear, Stormtight will effectively and permanently seal them up. Used as a complete covering, it makes a permanent, one piece job without seams or laps, at a very low cost. Heat, rain, storm or cold does not affect it. Stormtight comes in two forms plastic or liquid, and requires no skill to apply. Sold under a definite guarantee. There is no such thing as risk for you. Full particulars are yours for the asking.

GUARANTEE

STORMTIGHT applied in accordance with our instructions is guaranteed to give absolute satisfaction and to protect a roof from leakage and keep it watertight for a period of ten (10) years.

We will replace free of charge any quantity of STORMTIGHT which after having been applied in accordance with said instructions proves defective.

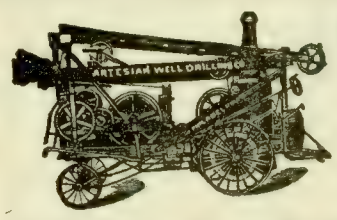
We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.



Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

FOR SALE

320 running feet Ornamental Wrought Iron Railing, 4 feet high, with polished oak top; suitable for use on staircase or corridors. Will sacrifice for quick sale. Apply to Room 205, 135 South Second St., Philadelphia, Pa.

(Continued from Page 352.)

Many large users of galvanized iron about their factories are beginning to realize that in order to secure the best results from a standpoint of economy and service, it is necessary to paint the iron at intervals of two or three years. This policy adds many years of life to their sheds and buildings on which the galvanized iron is used.—*Exchange.*

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soul with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

The impractical dreamers are not the architects, but the clients themselves, as a rule.

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

The man who doesn't advertise, these days, is forgotten. The world is too busy to look up dead ones.

Building Lime—Buy pure lime, no core, no grit—Chemical Lime. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Phila. Both 'phones.

Brownstone Bricks

Reading Sidings.

These are high grade pressed bricks, manufactured of crushed stone and hydrated lime. Greater crushing strength and lower absorption than burned clay. Uniform in shape and size. No soft ones. They are beautiful, economical and everlasting.

Red, Gray & Buff Face Bricks

A complete range of colors. Manufactured of vitrifying shale and fire clay. Our prices defy competition.

Straight Hard, Stretcher and Salmon Bricks

All Shale Bricks in carload lots, delivered on job at competitive prices. We are shipping 200,000 bricks daily to 28 building operations.

Vitrified Paving Bricks

Standard specification pavers at lowest market price.

A Few of the Reasons

why you should install the **Peninsular Combination Range:**

A Range that burns either Gas, Coal or Wood without any changing or removing of parts—separate or both at the same time—whose oven is always ready for instant use.

A Range that takes up no more space than an ordinary kitchen range, bakes and broils perfectly under all conditions and gives a lifetime of such service.

A Range that makes the kitchen cool in Summer, warm in Winter—beautiful in design, substantial, and easy to keep clean. Secure our prices.

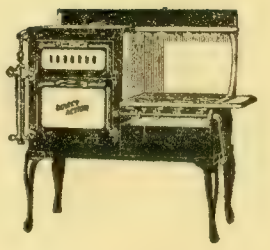
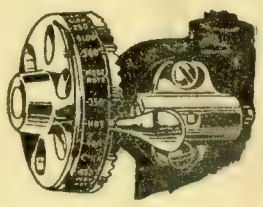
Cement, Lime, Sand, Gravel, Plaster, Concrete Stone and Pebbles



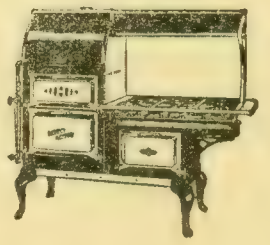
Place your orders with us. We have for years satisfied our customers. **WHY NOT YOU?**



P. H. FAIRLAMB CO. - 115 to 121 S. 30th Street Philadelphia

One of the many "reasons why" so many homes in and near Philadelphia are being equipped with the

Direct Action Gas Range



is that its patented oven heat regulator eliminates all guess work in cooking and enables one to obtain the same results at all times. It SAVES GAS, TIME, FOOD and WORRY!

We have it connected up with gas on our sample floor and shall be glad to have you and your clients call any time to witness a demonstration. An attractive booklet showing the entire line is yours for the asking.

BORDEN STOVE CO., 1311-1313 Arch St., Phila.

The Touraine Apts, 1520 Spruce street; the Daniel E. Hogan Operations at 54th and Wynnefield avenue, and 60th and Columbia avenue; the William Pilton Operation at 5959 Larchwood avenue; and the Presser Operation at Yeadon, Pa. are a few of the many operations which are enjoying the advantages of the DIRECT ACTION GAS RANGE.

As The Editor Sees It

FOR the past year we have all been appalled at the chaotic conditions in the industrial world—strikes seem to be the order of the day; inefficiency and high wages have been running a race with each other, and, in bewilderment, we ask ourselves, "how will it all end?"

When we see that, in Chicago, men are actually striking against their own unions, we feel that the peak of the situation has been reached.

However, the inevitable sliver lining is beginning to show itself—just at the moment when the cloud seems blackest.

For several months we have been hearing and preaching the doctrine of co-operation. Many wise heads have realized that co-operation on the part of employer and employe, of unions and business executives, is essential to the restoring of sane, normal business conditions. Now, if ever, the world needs the honest, conscientious labor of everyone, whether he be employer or employee; furthermore, all workers—and, who in the world is not a worker?—must realize their interdependence—capital is depenident on labor and vice versa; the individual is dependent on the whole of which he is a part and the whole is dependent on each of its individual components. As we said, when things seem blackest and unrest at its highest, comes the encouraging news from Labor of Philadelphia that it is 100% behind the project to relieve housing congestion. William J. Haggerty, representing the Philadelphia Council of Associated Building Trades, said, "All things being equal Philadelphia labor will mobilize at once and get behind the plan and turn out the best possible job from the standpoint of quantity and quality."

England is experiencing a labor awakening among the building trades, expressed by the Manchester Building Guild scheme. According to the "Journal of the American Institute of Architects," "Not for profits do these workers contend. They propose to develop a method of building which shall be based upon the principle of quality, and thus to rescue architecture from its present drift toward standardization and sterilization. They propose to organize the building industry so that workmen will be guaranteed a full week's work and pay, each workman becoming, in effect, a salaried member of the Guild. More than that, they have enlisted the active co-operation of architects and of intelligent contractors, whose skilled service must form a part of guild development."

Commenting on the Guild, the *London Daily News* says:

"Whatever comes of it, the Manchester Building Scheme is a most extraordinarily interesting experiment. The essence of the scheme, as explained by Mr. Hobson, is that homes are to be built at net cost (that is to say, cost of labor and materials) plus 10 per cent. This 10 per cent. would not be profit, but would be utilized to meet overhead charges—such as management expenses, etc.—to purchase plant (which would be vested in trustees) and to meet the obligations which the Guild would undertake towards labor. The Guild is already sufficiently confident to declare that so soon as its organization can be extended from a Manchester to a Northwestern Guild it will be prepared to undertake the building of 100,000 houses. That is a fair enough retort in itself to the Prime Minister's accusation against Labor of delaying the necessary house building. But the most remarkable and the most hopeful feature of this scheme is the spirit behind it. The revolt of the workman against bad workmanship and jerry building is by no means confined to Manchester; but it is enshrined in this Manchester scheme. If it prove effective in operation, a thing will have been done greater than the building of any number of houses, desperate as the house-famine is. We shall be fairly in sight of a revival of the spirit of craftsmanship which was the pride and glory of the Middle Ages. It will not be confined to any one trade; it will be an industrial revolution as tremendous in its results as that which changed the face of England last century, and free its very nature from

ACTIVITIES OF BUILDERS EXCHANGES IN PHILADELPHIA

Members of the Builders Exchange are to be congratulated on the selection of speakers that have made addresses at the weekly luncheons since their revival. Last Wednesday those present were delighted by the expression and assurance of greater co-operation between architects, builders and the building fraternity when David Knickerbocker Boyd, Philadelphia's progressive architect, voiced the sentiments of the Architectural Profession. Mr. Boyd made clear the many advantages of working more closely together and convinced his audience that the work of good architects would be more appreciated and the poor work of inferior architects would be soon disregarded if builders would get together and refuse to figure on carelessly planned drawings and loosely prepared specifications. Inexperienced, fly-by-night builders only, according to Mr. Boyd, are satisfied to take chances estimating on any kind of plans, not realizing the importance of following definite, positive drawings and specifications.

Mr. Boyd emphasized the fact that too often commissions appointed by cities, states, and the Federal Government have not included architects and builders, principally because these two classes of men have generally evaded activities of such character and have requently shown a disposition of indifference. We agree with Mr. Boyd that a spirit of reluctance has prevailed in the past, but the interest and enthusiasm manifested recently by President E. E. Hollenback of the Builders Exchange in city and public spirited movements is evidence that builders will, hereafter, influence to a great extent formation of policies and settlement of city problems, particularly the most urgent one at present, namely securing of shelter for inhabitants of cities.

In speaking of housing Mr. Boyd dwelt at length on the necessity of using materials extracted and manufactured from earth rather than lumber, which at the rate it is now being used will in ten years exhaust the supply of some k nds, particularly spruce.

Mr. Thomas Armstroing, Chairman at the luncheon, complimented very highly the sentiments of Mr. Boyd and expressed the feeling that greater harmony and more real pleasure in life would result if more architects and builders would follow the suggestions made.

Wednesday, April 15th, Mr. Thomas S. Holden, Chief Statistician of the F. W. Dodge Co., will talk at the luncheon and endeavor to show why the cost of buildings is going so high.

Tuesday evening, April 20th, at the Exchange Building, there will be a combination corporation meeting, vaudeville and smoker for the members of the Exchange. The Entertainment Committee promises an interesting and most enjoyable entertainment. Every member is urged to come out that evening and help to make the meeting a big success.

May 13th, the famous Annual Shad Dinner of the Exchange will be held at Mineral Springs Hotel. This will be a great occasion. Note this on your calendar, so that you will be there.

WHO BULLED THE MATERIAL MARKET?

By A. E. WELLS, *President,*
Wells Brothers Construction Co.

Have we an actual shortage of building materials or a theoretical shortage? Should prices reflect a theoretical scarcity? These are pertinent questions.

We are in the midst of an orgy of building. When the Armistice was signed, a few longheaded owners went ahead immediately. Some merely went into print telling the country of their firm conviction that prices were due to advance and not to recede and that construction on the cost basis of late 1918 and early 1919 was low compared to what we might expect for many years thereafter. Others wisely backed that belief by construction.

But the bulk of thought on the part of those whose money was to be expended was, "Let's wait and see." Months passed. Then came the deluge, a hundred million dollars of building permits in a single week and an astounding total for the year 1919, covering not only building construction, but pavements, sewers, dams and every character of public and private construction. The end is not yet in sight, but certain results are becoming distressingly evident.

As work opened up everyone began bidding for structural steel, reinforcing steel, steel sash, cement, tile and brick. As production was short, visible supplies vanished. Inevitably prices went up except for a few notable exceptions.

The sane men of finance and business were opposed to having prices rise still higher and advocated at least the holding of the price level prevailing at the end of war. This promised a continuance of wage scales at existing levels until such time as the cost of living might be reduced.

Yet the action of owners and of con-

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Right—from every Standpoint

In the contracting business a man soon learns that "half the job is in knowing how"—the other half is in using the right materials. This applies just as much to *making roofing* as it does to *building a skyscraper.*

Barrett Everlastic Roofings are made of the very best grade of waterproofing materials. And all the knowledge and skill we've gained in 60 years of manufacturing experience go into them.

That means these roofings are *right* from every standpoint—they're low in cost, quick and easy to lay, and they give long, trouble-free service.
